**Usage notes** The resiliency-link is only used when a backup member loses connectivity with the master via the stacking cables. Such a communication loss would occur if:

- a stacking link is removed or fails
- two or more stacking link cables are unplugged or fail
- the stack master itself fails due to a reboot or power failure

The resiliency-link allows the backup member to determine if the master is still present in the network by the reception of healthcheck messages sent by the master over the resiliency-link interface.

Reply healthcheck messages are received if the master is still online, but the stack will now split into two different “stubs”. The stub containing the existing master will continue operating as normal. The member in the masterless stub will now use a “type stack disabled-master” trigger to run a configuration to form a second temporary stack. This utilizes the remaining stack member’s resources without conflicting directly with the master’s configuration. If no “type stack disabled-master” trigger was configured on the switches, then the masterless stub member will disable its switch ports.

If no healthcheck messages are received, then the master is assumed to be completely offline, and so the other stack member can safely take over the master’s configuration.

**CAUTION:** *The purpose of the resiliency link is to enable the backup master to check the status of the master under fault conditions. If the resiliency link is not configured, and the master loses communication with its other stack member, then the stack will assume the master is NOT present in the network, which could cause network conflicts if the master is still online.*

**Example** To set the resiliency link to be eth0, use the following commands:

```
awplus# configure terminal
awplus(config)# stack resiliencylink eth0
```

To set the resiliency link to be VLAN 4093, first create VLAN 4093 as the resiliencylink VLAN. You do not have to use **vlan database** to create the VLAN, because the **stack resiliencylink** command creates it:

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next assign VLAN 4093 to the interface port, in this case port1.0.1:

```
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

- [switchport resiliencylink](#)

# stack software-auto-synchronize

**Overview** This command re-enables the software version auto-synchronization feature either on a specified stack member or all stack members.

Use the **no** variant of this command to turn the software version auto-synchronization feature off.

**Syntax** `stack {all|<stack-ID>} software-auto-synchronize`  
`no stack {all|<stack-ID>} software-auto-synchronize`

| Parameter  | Description                       |
|------------|-----------------------------------|
| all        | All stack members.                |
| <stack-ID> | Stack member number, from 1 to 4. |

**Default** Enabled on all stack members

**Mode** Global Configuration

**Usage notes** This command is used to enable the software version auto-synchronization feature for either a specific stack member or all stack members and candidates.

Note that if a device attempts to join a stack but is running a software release that is different to the other stack members, the software version auto-synchronization feature will copy the master's software release onto the new member. If the software version auto-synchronization feature is not enabled, then the device will be unable to join the stack.

Note that the software version auto-synchronization feature may also result in the stack member downgrading its software release if the master is running an older software version.

**Examples** To turn on the software-auto-synchronize feature on stack member 2, which was previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack 2 software-auto-synchronize
```

To turn on the software-auto-synchronize feature for all stack members, which were previously turned off, use the following commands:

```
awplus# configure terminal
awplus(config)# stack all software-auto-synchronize
```

**Related commands** [show stack](#)

# stack virtual-chassis-id

**Overview** This command specifies the stack virtual chassis ID. The ID selected will determine which virtual MAC address the stack will use. The MAC address assigned to a stack must be unique within its network.

**NOTE:** *The command will not take effect until the switch has been rebooted.*

**Syntax** `stack virtual-chassis-id <id>`

| Parameter               | Description  |
|-------------------------|--|
| <code>&lt;id&gt;</code> | The value of the ID - enter a decimal number in the range 0 to 4095. |

**Mode** Global Configuration

**Usage notes** The virtual-chassis-id entered will form the last 12 bits of a pre-selected MAC prefix component; that is, 0000.cd37.0xxx. If you enable the stack virtual MAC address feature (by using the [stack virtual-mac](#) command) without using the `stack virtual-chassis-id` command to select the virtual-chassis-id, then the stack will select a virtual-chassis-id from a number within the assigned range.

**Example** To set the stack virtual-chassis-id to 63 use the commands

```
awplus# configure terminal
awplus(config)# stack virtual-chassis-id 63
```

This will result in a virtual MAC address of 0000.cd37.003f.

**Related commands**

- [show running-config](#)
- [show stack](#)
- [switch provision \(stack\)](#)
- [stack virtual-mac](#)

# stack virtual-mac

**Overview** This command enables the stack virtual MAC address feature. For more information on this topic, see the [VCStack Feature Overview and Configuration Guide](#). With this command set, the value used as the virtual MAC address is determined by the setting of the command [stack virtual-chassis-id](#).

You must enable **stack virtual-mac**, in order to minimize data loss if a new stack member is required to become the VCStack master.

Before enabling the virtual MAC address feature, you should check that the stack's virtual-chassis-id is not already used by another stack in the network. Otherwise the duplicate MAC addresses will cause problems for the network traffic.

**Syntax** `stack virtual-mac`  
`no stack virtual-mac`

**Default** The stack virtual MAC address feature is disabled by default. However, if you manually turn on stacking (by entering the **stack enable** command), then that enables the stack virtual MAC address feature as well.

**Mode** Global Configuration

**Usage notes** Note that this command will not take effect until the switch has been rebooted.

**Example**

```
awplus# configure terminal
awplus(config)# stack virtual-mac
```

**Related commands** [show running-config](#)  
[show stack](#)  
[switch provision \(stack\)](#)  
[stack virtual-chassis-id](#)

# stackport

**Overview** Use this command to enable a port to become a stacking port. This means you can stack the switch through any of its ports.

Use the **no** variant of this command to return the port to being a network port.

**Syntax** stackport  
no stackport

**Default** No ports are configured as stacking ports.

**Mode** Interface mode

**Usage notes** After changing ports to or from stacking ports, reboot the switch. You need to do this before cabling the switches together into a stack. For step-by-step instructions in how to set up a stack, see [Virtual Chassis Stacking \(VCStack\) Feature Overview and Configuration Guide](#).

**Example 1** To configure ports 1 and 2 as stacking ports, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.2
awplus(config-if)# stackport
awplus(config-if)# exit
awplus(config)# exit
awplus# write
awplus# reboot
```

Once you have set the stack ports on both switches, then you can cable the stack.

**Related commands** [show stack detail](#)

**Command changes** Version 5.4.7-2.1: command added to x908 GEN2, x950.  
Version 5.4.7-0.1: command added to XS900MX.

# switch bay provision (xem)

**Overview** This command enables you to pre-configure a specific empty bay within a switch ready for inserting a particular XEM type. To run this command, the bay must be empty.

Use the **no** variant of this command to remove an existing switch provision.

**Syntax** `switch <stack-ID> bay <bay-ID> provision  
{xem2-1 | xem2-4 | xem2-8 | xem2-12}`  
`no switch <stack-ID> bay <bay-ID> provision`

| Parameter  | Description  |
|------------|--|
| <stack-ID> | The stack member switch position to be provisioned, from 1 to 4. |
| <bay-ID>   | The switch bay to be provisioned, from 1 to 8.                   |
| xem2-1     | Provision a 1-port XEM2.   |
| xem2-4     | Provision a 4-port XEM2.   |
| xem2-8     | Provision an 8-port XEM2.  |
| xem2-12    | Provision a 12-port XEM2.  |

**Mode** Global Configuration

**Examples** To provision a XEM2-12XS or XEM2-12XT in bay 1, use the following commands:

```
awplus# configure terminal  
awplus(config)# switch 1 bay 1 provision xem2-12
```

To remove the above provisioning, use the following commands:

```
awplus# configure terminal  
awplus(config)# no switch 1 bay 1 provision
```

**Related commands**

- [show stack](#)
- [show provisioning \(stack\)](#)
- [show provisioning \(xem\)](#)
- [switch provision \(stack\)](#)

# switch provision (stack)

**Overview** This command enables you to provide the configuration for a new stack member switch prior to physically connecting it to the stack. To run this command, the stack position must be vacant. The selected hardware type must be compatible with existing stack hardware.

Use the **no** variant of this command to remove an existing switch provision.

**Syntax** `switch <stack-ID> provision {x950-28}`  
`no switch <stack-ID> provision`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;stack-ID&gt;</code> | Stack member number, from 1 to 4.   |
| <code>provision</code>        | Provides settings within the stack configuration ready for a specific switch type to become a stack member. |
| <code>x950-28</code>          | Provision a 28-port x950 switch.  |

**Mode** Global Configuration

**Usage notes** Note that although the syntax appears to allow provisioning on up to 8 stackable switches, in practice a maximum of 4 are configurable. Normally the stack members would be numbered 1 to 4, and so the command could be run to provision any stack member within this range; and we advise this procedure. In effect, the syntax then becomes:

```
switch <1-4> provision x950-28
```

However, you can number the stack units with any numbers between 1 and 8. For example you could number your four stack members 1, 2, 7 and 8, if you wish. In this case you could provision any of the stack members by using one of those numbers. We advise against numbering your stacks in this way.

**Examples** To provision an x950-28XSQ switch as stack member 3, use the following commands:

```
awplus# configure terminal  
awplus(config)# switch 3 provision x950-28
```

To remove the provision of the x950-28XSQ switch as stack member 3, use the following commands:

```
awplus# configure terminal  
awplus(config)# no switch 3 provision
```

**Related commands** [switch bay provision \(xem\)](#)  
[show provisioning \(stack\)](#)  
[show stack](#)

**Command changes** Version 5.4.8-1.1: SBx908 GEN2 syntax changed

# switchport resiliencylink

**Overview** This command configures the switch port to be a member of the stack resiliency link VLAN. Note that this switchport will only be used for stack resiliency-link traffic and will not perform any other function, or carry any other traffic.

The **no** variant of this command removes the switchport from the resiliency link VLAN.

**Syntax** `switchport resiliencylink`  
`no switchport resiliencylink`

**Mode** Interface Configuration

**Usage notes** Note that a resiliency link cannot be part of a static or dynamic aggregator group.

**Examples** To set the resiliency link to be VLAN 4093:

First, use the **stack resiliencylink** command to create the resiliency-link vlan `vlan4093`

```
awplus# configure terminal
awplus(config)# stack resiliencylink vlan4093
```

Next, use the **switchport resiliencylink** command to assign the resiliency-link vlan to the port, in this case `port1.0.1`.

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport resiliencylink
```

**Related commands** [stack resiliencylink](#)  
[show stack resiliencylink](#)

## vlan mode stack-local-vlan

**Overview** This command enables you to create stack-local-VLANs and use ICMP to monitor and diagnose issues within specific members of the stack. When a VLAN is added using this method, all its traffic will be trapped to and processed by the CPU of the specific local stack member, rather than the CPU of the stack master.

The **no** variant of this command destroys the specified VLAN.

**Syntax** `vlan <vid> mode stack-local-vlan <member-id>`  
`no vlan <vid>`

| Parameter             | Description   |
|-----------------------|---|
| <vid>                 | The VID of the VLAN to be created in the range 2-4094. We recommend that the first stack-local-vlan be assigned the number 4001 for the first stack member, then incremented by one for each stack member. For example, a stack of four members would be assigned the following VID numbers: <ul style="list-style-type: none"><li>• stack member one: VID 4001</li><li>• stack member two: VID 4002</li><li>• stack member three: VID 4003</li><li>• stack member four: VID 4004</li></ul> |
| mode stack-local-vlan | Specifies that the new VLAN will function as a stack-local-VLAN.  |
| <member-id>           | Specifies the stack member ID. Enter a decimal number in the range 1-4.   |

**Default** By default, VLANs are automatically enabled as they are added.

**Mode** VLAN Configuration

**Usage notes** If IGMP snooping is operating on a stack-local-VLAN, the device will try to process some multicast traffic via that VLAN, if it is connected to a Microsoft Windows PC. To avoid this, we recommend disabling IGMP snooping on stack-local-VLANs, by using the command **no ip igmp snooping**.

**Examples** To add a stack-local-VLAN with the VID of 4002 and assign it to stack member 2, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# vlan 4002 mode stack-local-vlan 2
awplus(config-vlan)# exit
awplus(config)# interface vlan4002
awplus(config-if)# no ip igmp snooping
```

To remove VLAN 4002, use the following commands:

```
awplus# configure terminal
awplus(config)# vlan database
awplus(config-vlan)# no vlan 4002
```

**Related commands**

- [mtu](#)
- [vlan database](#)

# undebug stack

**Overview** This command applies the functionality of the **no debug stack** command.

# xem enable

**Overview** Use this command to enable a XEM in a switch's XEM bay. The switch can be a standalone switch or a member of a VCStack. XEMs are enabled by default.

Use the **no** variant of this command to disable a XEM. The XEM will be disabled immediately. If you save the configuration, the XEM will stay disabled even if a reboot or a hot swap on that XEM bay occurs. This can be useful if you have a faulty XEM, because it means you can leave the faulty XEM in place while waiting for its replacement to arrive.

**Syntax** `xem <bayid> enable`  
`no xem <bayid> enable`

| Parameter | Description  |
|-----------|--|
| <bayid>   | The ID number of the XEM bay to disable or enable, in the format stack-member.bay-number. For example, 2.1 indicates bay 1 on stack member 2.<br>x950 Series switches have 1 XEM bay, which has a bay-number of 1. |

**Default** XEM bays are enabled by default.

**Mode** Global Configuration

**Example** To disable a faulty XEM that is in bay 1 of stack member 2, use the commands:

```
awplus# configure terminal
awplus(config)# no xem 2.1 enable
awplus(config)# exit
awplus# write
```

To enable the replacement XEM after adding it to that XEM bay, use the commands:

```
awplus# configure terminal
awplus(config)# xem 2.1 enable
awplus(config)# exit
awplus# write
```

**Command changes** Version 5.4.9-0.1: mode changed to Global Configuration

# advertisement-interval

**Overview** Use this command to configure the advertisement interval of the virtual router. This is the length of time, in seconds, between each advertisement sent from the master to its backup(s).

IPv6 VRRP advertisements are sent to the multicast address assigned to the VRRP group (ff02:0:0:0:0) and a backup virtual router has to join all multicast groups within this range. VRRP advertisements are sent to a multicast address (ff02::12) every second by default.

Use the **no** variant of this command to remove an advertisement interval of the virtual router, which has been set using the **advertisement-interval** command, and revert to the default advertisement interval of 1 second.

**Syntax** advertisement-interval [`<1-255>`|csec `<1-4095>`]  
no advertisement-interval

| Parameter                   | Description   |
|-----------------------------|---|
| <code>&lt;1-255&gt;</code>  | Specifies the advertisement interval in seconds.                    |
| csec                        | Use centiseconds instead of seconds for the advertisement interval. |
| <code>&lt;1-4095&gt;</code> | Specifies the advertisement interval in centiseconds.               |

**Default** The default advertisement interval is 1 second.

**Mode** Router Configuration

**Usage notes** Note when using VRRP with VCStacking, ensure the VRRP advertisement-interval is larger than the VCStacking failover time to avoid VCStacking failovers causing VRRP failovers.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- setting the advertisement-interval when configuring VRRP
- using seconds for VRRPv2 host compatibility whenever you use [transition-mode](#) to upgrade or transition from VRRPv2 to VRRPv3
- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details

**NOTE:** When using VRRPv3 with VCStacking, ensure that the VRRPv3 advertisement-interval is configured to a longer time than the VCStacking failover time.

If the VRRPv3 advertisement-interval is shorter than the VCStacking failover time, then a VRRPv3 failover will also occur whenever a VCStacking failover occurs. Use seconds not centiseconds to ensure interoperability with VRRPv2.

**Examples** The example below shows you how to configure the advertisement interval to 6 seconds for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

The example below shows you how to reset the advertisement interval to the default of 1 second for the VRRP IPv4 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no advertisement-interval
```

The example below shows you how to configure the advertisement interval to 6 seconds for the VRRPv3 IPv6 session with VR ID 5 on interface vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan2
awplus(config-router)# advertisement-interval 6
```

**Related commands** [router vrrp \(interface\)](#)  
[router ipv6 vrrp \(interface\)](#)

# alternate-checksum-mode

**Overview** Use this command to enable an alternate checksum mode for VRRPv3 to allow inter-operability with some other vendors' products. The IPv4 checksum for VRRPv3 advertisements will then use a pseudo header in the calculation.

This mode may be required if the other product indicates checksum errors on VRRP packets sent by AlliedWare Plus devices.

Use the **no** variant of this command to disable the alternate checksum mode.

**Syntax** `alternate-checksum-mode`  
`no alternate-checksum-mode`

**Default** Disabled

**Mode** Router Configuration

**Example** To turn on the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# alternate-checksum-mode
```

To turn off the alternate checksum mode for VRRP instance 1 on VLAN1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# no alternate-checksum-mode
```

**Related commands** [show running-config](#)

**Command changes** Version 5.4.7-1.1: command added

# circuit-failover

**Overview** Use this command to enable the VRRP circuit failover feature.

Circuit failover enables the device to take action if the uplink interface goes down, so that the VRRP backup, whose uplink interface is still active, takes over as VRRP master. See the Usage section below and the [VRRP Feature Overview and Configuration Guide](#) for more information.

Use the **no** variant of this command to disable this feature.

**Syntax** `circuit-failover <interface> <1-253>`  
`no circuit-failover [<interface> <1-253>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;interface&gt;</code> | The interface of the router that is monitored. The interface must exist on the router, and is usually an upstream interface. Should the interface go down, then another router that is configured as a backup router in the group takes over as the master. You should configure the circuit failover on an interface other than the active VRRP interface - generally the uplink interface. |
| <code>&lt;1-253&gt;</code>     | Delta value. The value by which virtual routers decrement their priority value during a circuit failover event. Configure this value to be greater than the difference of priorities on the master and backup routers. In the case of failover, this priority delta value is subtracted from the current VR Master Router priority value.  |

**Mode** Router Configuration

**Usage notes** You can use Circuit Failover to monitor up to 32 interfaces per VRRP instance. If a VRRP instance is configured to monitor multiple interfaces, the VRRP priority will be cumulatively decremented by the configured delta for each interface as it goes down.

For example, if VRRP is configured to monitor VLAN2 and VLAN3 with the commands:

```
awplus# configure terminal
awplus(config)# interface vlan1
awplus(config-if)# ip address 192.168.1.1/24
awplus(config-if)# exit
awplus(config)# router vrrp 1 vlan1
awplus(config-router)# virtual-ip 192.168.1.10 backup
awplus(config-router)# priority 100
awplus(config-router)# circuit-failover vlan2 10
awplus(config-router)# circuit-failover vlan3 20
```

then the following examples explain the effect of each VLAN going down:

- If only VLAN2 fails, then the VRRP priority will be decremented by 10. VRRP priority would be adjusted to become 90, because  $100 - 10 = 90$ .
- If only VLAN3 fails, then the VRRP priority will be decremented by 20. VRRP priority would be adjusted to become 80, because  $100 - 20 = 80$ .
- If both VLAN2 and VLAN3 fail, then the VRRP priority will be decremented by the cumulative delta values of all monitored interfaces. VRRP priority would therefore be adjusted to become 70, because  $100 - 10 - 20 = 70$ .

As each monitored interface recovers, the VRRP priority is incremented by the same delta value.

When you configure the delta values of the monitored interfaces, make sure their sum is high enough to ensure that the VRRP priority stays above zero if all the interfaces go down.

**Examples** To configure circuit failover on an IPv4 VRRP instance, so that if interface VLAN3 goes down, then the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRP IPv4 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

To configure circuit failover on a VRRPv3 IPv6 session with VR ID 1, so that when interface VLAN3 goes down, the priority of VRRP instance 1 is reduced by 30, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# circuit-failover vlan3 30
```

To remove all configured circuit failovers for the VRRPv3 IPv6 session with VR ID 1 on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 1 vlan2
awplus(config-router)# no circuit-failover
```

**Related commands** [router vrrp \(interface\)](#)  
[router ipv6 vrrp \(interface\)](#)

# debug vrrp

**Overview** Use this command to specify debugging options for VRRP. The **all** parameter turns on all the debugging options.

Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp [all]`  
`no debug vrrp [all]`

**Mode** Privileged Exec and Global Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp all
```

The example below shows you how to disable all debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp all
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp](#)

# debug vrrp events

**Overview** Use this command to specify debugging options for VRRP event troubleshooting. Use the **no** variant of this command to disable this function.

**Syntax** `debug vrrp events`  
`no debug vrrp events`

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp events** command enables the display of debug information related to VRRP internal events.  
See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp events
```

The example below shows you how to disable events debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp events
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp events](#)

# debug vrrp packet

**Overview** Use this command to specify debugging options for VRRP packets.  
Use the **no** variant of this command to disable this function.

**Syntax** debug vrrp packet [send|recv]  
no debug vrrp packet [send|recv]

| Parameter | Description  |
|-----------|--|
| send      | Specifies the debug option set for sent packets.     |
| recv      | Specifies the debug option set for received packets. |

**Mode** Privileged Exec and Global Configuration

**Usage notes** The **debug vrrp packet** command enables the display of debug information related to the sending and receiving of packets.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Examples** The example below shows you how to enable received and sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet
```

The example below shows you how to enable only received packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet recv
```

The example below shows you how to enable only sent packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# debug vrrp packet send
```

The example below shows you how to disable packet debugging for VRRP:

```
awplus# configure terminal
awplus(config)# no debug vrrp packet
```

**Related commands** [show debugging vrrp](#)  
[undebug vrrp packet](#)

# disable (VRRP)

**Overview** Use this command to disable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router to stop it participating in virtual routing. Note that when this command is configured then a backup router assumes the role of master router depending on its priority. See the [enable \(VRRP\)](#) command to enable a VRRP IPv4 session or a VRRPv3 IPv6 session on the router.

**Syntax** `disable`

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to disable the VRRP session for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# disable
```

The example below shows you how to disable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# disable
```

**Related commands**

- [enable \(VRRP\)](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)

# enable (VRRP)

**Overview** Use this command to enable the VRRP session on the router to make it participate in virtual routing. To make changes to the VRRP configuration, first disable the router from participating in virtual routing using the [disable \(VRRP\)](#) command.

**Syntax** enable

**Mode** Router Configuration

**Usage notes** You must configure the virtual IP address and define the interface for the VRRP session (using the [virtual-ip](#) or [virtual-ipv6](#) and the [router vrrp \(interface\)](#) or [router ipv6 vrrp \(interface\)](#) commands) before using this command.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** To enable the VRRP session for VRRP VR ID 5 on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# enable
```

To enable the VRRPv3 session for VRRPv3 VR ID 3 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# enable
```

**Related commands**

- [disable \(VRRP\)](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)
- [show vrrp](#)
- [virtual-ip](#)
- [virtual-ipv6](#)

# preempt-mode

**Overview** Use this command to configure preempt mode. If preempt-mode is set to **true**, then the highest priority backup will always be the master when the default master is unavailable.

If preempt-mode is set to **false**, then a higher priority backup will not preempt a lower priority backup who is acting as master.

If preempt-mode is set to **true**, an extra parameter is available called **delay-time**. If the delay-time parameter is used, a VRRP router with a higher priority will wait the configured length of time before it preempts the lower priority VRRP router to take over as master.

**Syntax** `preempt-mode {true|false}[delay-time <0-3600>]`

| Parameter  | Description   |
|------------|---|
| true       | Preemption is enabled.  |
| false      | Preemption is disabled.   |
| delay-time | Enable preempting but delay the preempt by the amount of seconds specified by the delay-time value. Note, a delay-time of 0 means delayed preempting is disabled. |

**Default** The default is **true**.

**Mode** Router Configuration

**Usage notes** When the master router fails, the backup routers come online in priority order—highest to lowest. Preempt mode means that a higher priority backup router will take over the master role from a lower priority backup. Preempt mode set to **true** allows a higher priority backup router to relieve a lower priority backup router.

By default, a preemptive scheme is enabled whereby a higher priority backup virtual router that becomes available takes over from the backup virtual router that was previously elected to become the master virtual router.

This preemptive scheme can be disabled using the **preempt-mode false** command. If preemption is disabled on a backup virtual router that is starting up, and this router has a higher priority than the current master, the higher priority backup will not preempt the current master, and the lower priority master will stay in the master role.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- preempt mode and preempt delay-time

**Examples** The example below shows you how to configure preempt-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure preempt-mode as true for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode true
```

The example below shows you how to configure preempt-mode as false for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# preempt-mode false
```

The example below shows you how to configure delay-time as 20 seconds for VRRPv3 VR ID 5 on vlan5:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 5 vlan5
awplus(config-router)# preempt-mode true delay-time 20
```

**Related commands**

- [circuit-failover](#)
- [priority](#)
- [router vrrp \(interface\)](#)
- [router ipv6 vrrp \(interface\)](#)

# priority

**Overview** Use this command to configure the VRRP router priority within the virtual router. The highest priority router is Master (unless [preempt-mode](#) is false).

Use the **no** variant of this command to remove the VRRP router priority within the virtual router, which has been set using the **priority** command.

**Syntax** `priority <1-255>`  
`no priority`

| Parameter | Description   |
|-----------|---|
| <1-255>   | The priority. For the master router, use 255 for this parameter; otherwise use any number from the range <1-254>. |

**Default** Defaults for priority are: **master router**= 255; **backup**= 100.

**Mode** Router Configuration

**Usage notes** Priority determines the role that each VRRP router plays and what happens if the master virtual router fails. If a VRRP router owns the IP address of the virtual router and the IP address of the interface, then this VRRP router functions as the master virtual router.

Priority also determines whether a VRRP router functions as a backup virtual router and the order of ascendancy to becoming a master virtual router if the master virtual router fails. Configure the priority of each backup virtual router with a value of 1 through 254.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 and IPv6 configuration details.

**Examples** The example below shows you how to configure 101 as the priority for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# priority 101
```

The example below shows you how to remove the priority configured for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no priority
```

The example below shows you how to configure 101 as the priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# priority 101
```

The example below shows you how to remove the configured priority for VRRPv3 VR ID 3 on vlan1:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no priority
```

**Related commands** [circuit-failover](#)  
[preempt-mode](#)

# router ipv6 vrrp (interface)

**Overview** Use this command to configure VRRPv3 for IPv6 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRPv3 for IPv6 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router ipv6 vrrp <vrid> <interface>`  
`no router ipv6 vrrp <vrid> <interface>`

| Parameter   | Description  |
|-------------|--|
| <vrid>      | <1-255> The ID of the virtual router VRRPv3 IPv6 session to create.  |
| <interface> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages. |

**Mode** Global Configuration

**Usage notes** Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to enable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan2
awplus(config-router)# enable
awplus(config-router)#
```

The example below shows you how to disable a VRRPv3 session with VR ID 3 on vlan2:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router ipv6 vrrp 3 vlan2
awplus(config)#
```

**Related  
commands** [advertisement-interval](#)  
[circuit-failover](#)

# router vrrp (interface)

**Overview** Use this command to configure VRRP IPv4 and define the interface that will participate in virtual routing to send and receive advertisement messages. This command allows you to enter the Router Configuration mode.

Use the **no** variant of this command to remove the VRRP IPv4 configuration. Disable the VRRP session before using the **no** variant of this command.

**Syntax** `router vrrp <vrid> <interface>`  
`no router vrrp <vrid> <interface>`

| Parameter   | Description  |
|-------------|--|
| <vrid>      | <1-255> The ID of the virtual router VRRP IPv4 session to create.  |
| <interface> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRP IPv4 advertisement messages. |

**Mode** Global Configuration

**Usage notes** Use the required <interface> placeholder to define the interface that will participate in virtual routing. This interface is used for two purposes - to send/receive advertisement messages and to forward on behalf of the virtual router when in master state.

**NOTE:** *Configuring a high number of instances may adversely affect the device's performance, depending on the device CPU, the other protocols it is running, and whether you set the advertisement interval to less than 1 second.*

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** To enable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan1
awplus(config-router)# enable
```

To disable a VRRP session with VR ID 5 on vlan1, use the commands:

```
awplus(config-router)# disable
awplus(config-router)# exit
awplus(config)# no router vrrp 5 vlan1
```

**Related  
commands**

- advertisement-interval
- circuit-failover
- disable (VRRP)
- enable (VRRP)

# show debugging vrrp

**Overview** Use this command to display the set VRRP debugging option. Use the terminal monitor command to display output on the console otherwise debug output is in the log file.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 debugging details.

**Syntax** `show debugging vrrp`

**Mode** User Exec and Privileged Exec

**Example** The example below shows you how to display VRRP debugging:

```
awplus# show debugging vrrp
```

**Related commands**

- [debug vrrp](#)
- [debug vrrp events](#)
- [debug vrrp packet](#)

# show running-config router ipv6 vrrp

**Overview** Use this command to show the running configuration for VRRPv3 IPv6.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRPv3 IPv6:

```
awplus# show running-config router ipv6 vrrp
```

**Output** Figure 57-1: Example output from the **show running-config router ipv6 vrrp** command

```
!  
router ipv6 vrrp 3 vlan3  
  virtual-ip fe80::202:b3ff:fed5:983e master  
  circuit-failover vlan3 3  
  advertisement-interval 6  
  preempt-mode false  
!
```

# show running-config router vrrp

**Overview** Use this command to show the running configuration for VRRP IPv4.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show running-config router vrrp`

**Mode** Privileged Exec, Global Configuration, Line Configuration, and Interface Configuration.

**Example** The example below shows you how to display the running configuration for VRRP IPv4:

```
awplus# show running-config router vrrp
```

**Output** Figure 57-2: Example output from the **show running-config router vrrp** command

```
!  
router vrrp 2 vlan2  
  circuit-failover vlan2 2  
  advertisement-interval 4  
  preempt-mode true  
!
```

# show vrrp

**Overview** Use this command to display information about all VRRP IPv4 sessions. This command shows a summary when the optional **brief** parameter is used.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** show vrrp [brief]

| Parameter | Description                     |
|-----------|---------------------------------|
| brief     | Brief summary of VRRP sessions. |

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp
```

To display brief summary output about VRRP IPv4 sessions, enter the command:

```
awplus# show vrrp brief
```

**Output** Figure 57-3: Example output from the **show vrrp** command

```
awplus#show vrrp
VMAC enabled
Address family IPv4
VRRP Id: 1 on interface: vlan2
State: AdminUp - Master
Virtual IP address: 192.168.1.2 (Not-owner)
Priority is 100
Advertisement interval: 100 centiseconds
Preempt mode: TRUE
Multicast membership on IPv4 interface vlan2: JOINED
Transition mode: FALSE
Accept mode: FALSE
Master address: 192.168.1.3
```

Figure 57-4: Example output from the **show vrrp brief** command

```
awplus#show vrrp brief
Interface      Grp  Prio  Own  Pre  State      Master addr      Group addr
vlan10         1    200   N    P    Master     192.168.10.4     192.168.10.253
vlan10         2    150   N    P    Backup     192.168.10.4     192.168.10.254
vlan11         3    200   N    P    Master     192.168.11.4     192.168.11.253
vlan11         4    150   N    P    Backup     192.168.11.4     192.168.11.254
```

**Related  
commands**    enable (VRRP)  
                  disable (VRRP)

# show vrrp counters

**Overview** This command displays VRRP SNMP counters on the console, as described in the VRRP MIB and RFC2787, for debugging use while you configure VRRP with commands in this chapter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show vrrp counters`

**Mode** User Exec and Privileged Exec

**Usage notes** The output has a section for global counters and a section of counters for each VRRP instance configured. See the descriptions of the counters below the sample output as per RFC2787.

**NOTE:** Note that the counters displayed with this commands are the same counters as described in RFC 2787 (Copyright (C) The Internet Society (2000). All Rights Reserved) except for the “Monitored Circuit Up” and “Monitored Circuit Down” counters, which are additions beyond the MIB.

**Example** To display information about VRRP SNMP counters on the console, enter the command:

```
awplus# show vrrp counters
```

Figure 57-5: Example output from the **show vrrp counters** command

```
awplus#show vrrp counters
VRRP Global Counters:
  Checksum Errors .... 230
  Version Errors ..... 0
  VRID Errors ..... 230

VRRP IPv4 counters for VR 10/vlan10:
  Master Transitions ..... 0
  Received Advertisements ... 0
  Internal Errors ..... 0
  TTL Errors ..... 0
  Received Priority 0 Pkt ... 0
  Sent Priority 0 Pkt ..... 0
  Received Invalid Type ..... 0
  Address List Errors ..... 0
  Packet Length Errors ..... 0
  Monitored Circuit Up ..... 0
  Monitored Circuit Down..... 0
```

```
VRRP IPv4 counters for VR 100/vlan100:
Master Transitions ..... 1
Received Advertisements ... 1614
Internal Errors ..... 0
TTL Errors ..... 0
Received Priority 0 Pkt ... 0
Sent Priority 0 Pkt ..... 0
Received Invalid Type ..... 0
Address List Errors ..... 0
Packet Length Errors ..... 0
Monitored Circuit Up ..... 0
Monitored Circuit Down.... 2
```

**Table 1:** Global counters with descriptions for the **show vrrp counters** command:

| Counter         | Description  |
|-----------------|--|
| Checksum Errors | The total number of VRRP packets received with an invalid VRRP checksum value.           |
| Version Errors  | The total number of VRRP packets received with an unknown or unsupported version number. |
| VRID Errors     | The total number of VRRP packets received with an invalid VRID for this virtual router.  |

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command:

| Counter                 | Description   |
|-------------------------|---|
| Master Transitions      | The total number of times that this virtual router's state has transitioned to MASTER.  |
| Received Advertisements | The total number of VRRP advertisements received by this virtual router.  |
| Internal Errors         | The total number of VRRP advertisement packets received for which the advertisement interval is different than the one configured for the local virtual router. |
| TTL Errors              | The total number of VRRP packets received by the virtual router with IP TTL (Time-To-Live) not equal to 255.  |
| Received Priority 0 Pkt | The total number of VRRP packets received by the virtual router with a priority of '0'.   |
| Sent Priority 0 Pkt     | The total number of VRRP packets sent by the virtual router with a priority of '0'.   |
| Received Invalid Type   | The number of VRRP packets received by the virtual router with an invalid value in the 'type' field.  |
| Address List Errors     | The total number of packets received for which the address list does not match the locally configured list for the virtual router.                              |

**Table 2:** Per VR counters with descriptions for the **show vrrp counters** command: (cont.)

| Counter                | Description  |
|------------------------|--|
| Packet Length Errors   | The total number of packets received with a packet length less than the length of the VRRP header. |
| Monitored Circuit Up   | The total number of times the monitored circuit has generated the UP event.                        |
| Monitored Circuit Down | The total number of times the monitored circuit has generated the down event.                      |

# show vrrp ipv6

**Overview** Use this command to display information about all configured VRRPv3 IPv6 sessions for all interfaces, or all VRRPv3 IPv6 sessions for a given interface with the optional parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Syntax** `show vrrp ipv6 [<interface>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;interface&gt;</code> | Specify the name of the interface that will participate in the virtual routing. The interface must exist on the router. The interface specified sends and receives VRRPv3 IPv6 advertisement messages. |

**Mode** User Exec and Privileged Exec

**Example** To display information about all VRRPv3 IPv6 sessions, enter the command:

```
awplus# show vrrp ipv6
```

**Output** Figure 57-6: Example output from the **show vrrp ipv6 vlan2** command

```
awplus#show vrrp ipv6 vlan2
VrId <1>
  State is Master
  Virtual IP is fe80::202:b3ff:fed5:983e (Owner)
  Interface is vlan2
  Priority is 255
  Advertisement interval is 4 sec
  Preempt mode is FALSE
```

**Related commands** [enable \(VRRP\)](#)  
[disable \(VRRP\)](#)

# show vrrp (session)

**Overview** Use this command to display information for a particular VRRP session.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Syntax** `show vrrp <vrid> <interface>`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;vrid&gt;</code>      | <code>&lt;1-255&gt;</code> The virtual router ID for which to display information. Session must already exist. |
| <code>&lt;interface&gt;</code> | The interface to display information about, for instance, <code>vlan2</code> .                                 |

**Mode** User Exec and Privileged Exec

**Usage notes** See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan2**. Output shows that a Virtual IP address has been set.

```
awplus# show vrrp 1 vlan2
```

```
awplus#show vrrp 1 vlan2
Address family IPv4
VrId <1>
  Interface is vlan2
  State is Initialize
  Virtual IP address is 10.10.11.250 (Not IP owner)
  Priority is 100
  Advertisement interval is 1 sec
```

See the below sample output from the **show vrrp** command displaying information about VRRP session 1 configured on **vlan3**. Output shows a Virtual IP address has not been set.

```
awplus# show vrrp 1 vlan3
```

```
awplus#show vrrp 1 vlan3
Address family IPv4
VrId <1>
Interface is vlan3
State is Initialize
Virtual IP address is unset
Priority is 100
Advertisement interval is 1 sec
Preempt mode is TRUE
```

**Example** The following command shows information about VRRP session 5 for interface **vlan2**.

```
awplus# show vrrp 5 vlan2
```

# transition-mode

**Overview** Use this command to configure the IPv4 transition mode. Transition mode allows you to upgrade from VRRPv2 to VRRPv3 and gives interoperability between VRRPv2 and VRRPv3.

If transition-mode is set to **true**, then the IPv4 transition mode is enabled and VRRPv2 and VRRPv3 advertisements are sent allowing VRRPv2 and VRRPv3 interoperability. Received VRRPv2 advertisement packets are accepted and processed when transition-mode is true.

If transition-mode is set to **false**, then the IPv4 transition mode is disabled and only VRRPv3 advertisements are sent. Received VRRPv2 advertisement packets are dropped.

Note the [advertisement-interval](#) should not be configured to less than 1 second when using transition-mode. VRRPv2 can only use advertisements in whole second intervals.

**Syntax** `transition-mode {true|false}`

| Parameter | Description   |
|-----------|---|
| true      | Transition mode is enabled. This results in VRRPv2 and VRRPv3 IPv4 advertisements being sent. Transition mode is only available on VRRPv3 for interoperability with VRRPv2 while upgrading to VRRPv3. |
| false     | Transition mode is disabled. This stops VRRPv2 IPv4 advertisements being sent. Only VRRPv3 advertisements are sent when disabled. Disable transition-mode after upgrading from VRRPv2 to VRRPv3.      |

**Default** The default is **false**.

**Mode** Router Configuration

**Usage notes** See the [VRRP Feature Overview and Configuration Guide](#) for more information:

- VRRPv3 IPv4 configuration details
- VRRPv3 IPv6 configuration details
- further information about configuring transition mode to upgrade from VRRPv2 to VRRPv3

**Examples** The example below shows you how to configure IPv4 transition-mode as true for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode true
```

The example below shows you how to configure IPv4 transition-mode as false for VRRP VR ID 5 on vlan2:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# transition-mode false
```

**Related commands** [router vrrp \(interface\)](#)

# undebug vrrp

**Overview** Use this command to disable all VRRP debugging.

**Syntax** `undebug vrrp all`

**Mode** Privileged Exec

**Example** The example below shows you how to disable all VRRP debugging:

```
awplus# undebug vrrp all
```

**Related commands** [debug vrrp](#)

# undebbug vrrp events

**Overview** Use this command to disable debugging options for VRRP event troubleshooting.

**Syntax** `undebbug vrrp events`

**Mode** Privileged Exec

**Example** The example below shows you how to disable VRRP event debugging:

```
awplus# undebbug vrrp events
```

**Related commands** [debug vrrp events](#)

# undebg vrrp packet

**Overview** Use this command to disable debugging options for VRRP packets.

**Syntax** `undebg vrrp packet [send|recv]`

| Parameter | Description  |
|-----------|--|
| send      | Disable the debug option set for sent packets.     |
| recv      | Disable the debug option set for received packets. |

**Mode** Privileged Exec

**Examples** The example below shows you how to disable VRRP sent packet debugging:

```
awplus# undebg vrrp packet send
```

The example below shows you how to disable VRRP received packet debugging:

```
awplus# undebg vrrp packet recv
```

The example below shows you how to disable all VRRP packet debugging:

```
awplus# undebg vrrp packet
```

**Related commands** [debug vrrp packet](#)

# virtual-ip

**Overview** Use this command to set the virtual IP address for the VRRP session. This is the IP address of the virtual router that end hosts set as their default gateway.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ip <ip-address> [master|backup|owner]`  
`no virtual-ip`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;ip-address&gt;</code> | The virtual IPv4 address of the virtual router, entered in dotted decimal format A.B.C.D.   |
| <code>master</code>             | Sets the default state of the VRRP router within the Virtual Router as <b>master</b> . For master, the router must own the Virtual IP address. Specify the <b>owner</b> option before using <b>master</b> option. |
| <code>backup</code>             | Sets the default state of the VRRP router within the Virtual Router as <b>backup</b> .  |
| <code>owner</code>              | Sets the IPv6 address of the VRRP router within the Virtual Router as the <b>owner</b> . Specify this before using the <b>master</b> option.  |

**Mode** Router Configuration

**Usage notes** The VRRP master and owner of the virtual IPv4 address for the VRRP session only responds to the packets destined to the virtual IPv4 address. The VRRP master that is not an owner of the virtual IPv4 address for the VRRP session does not respond to the packets destined to the virtual IPv4 address, but forwards packets with a VMAC as the destination address. See the [vrrp vmac](#) command to enable and disable this feature.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv4 configuration details.

**Examples** The example below shows you how to set the virtual IP address for VRRP VR ID 5 and the router as the VRRP master:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 master
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as the VRRP backup:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 backup
```

The example below shows you how to set the virtual IPv4 address for VRRP VR ID 5 and the router as owner of the virtual IPv4 address:

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# virtual-ip 192.0.2.30 owner
```

The example below shows you how to disable the virtual IPv4 address for VRRP VR ID 5

```
awplus# configure terminal
awplus(config)# router vrrp 5 vlan2
awplus(config-router)# no virtual-ip
```

**Related commands**

- [router vrrp \(interface\)](#)
- [enable \(VRRP\)](#)
- [vrrp vmac](#)

# virtual-ipv6

**Overview** Use this command to set the virtual IPv6 address for the VRRPv3 session. This is the IPv6 address of the virtual router that end hosts set as their default gateway.

Note that the primary IPv6 address specified is an IPv6 link-local address. See the Usage note below for further information.

Use the **no** variant of this command to disable this feature.

**Syntax** `virtual-ipv6 <ipv6-address> [master|backup]  
[primary|secondary]`  
`no virtual-ipv6`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;ipv6-address&gt;</code> | The IPv6 address of the virtual router, entered in hexadecimal, in the format X:X::X.X.  |
| <code>master</code>               | Sets <b>master</b> to be the default state of the VRRPv3 router within the Virtual Router. For <b>master</b> , we recommend using a Virtual IP address that is not owned by any of the VRRP routers in the same grouping (that share the same VRID). |
| <code>backup</code>               | Sets <b>backup</b> to be the default state of the VRRPv3 router within the Virtual Router.   |
| <code>primary</code>              | Sets the specified address as the primary IPv6 address. The primary address must be a link-local IPv6 address.   |
| <code>secondary</code>            | Sets the specified address as the secondary IPv6 address. Normally this would be a globally-routable IPv6 address. This enables you to specify a globally-routable address as the default gateway address for all the hosts on a VLAN.               |

**Mode** Router Configuration

**Usage notes** The virtual router will reply to ping, telnet, and SSH requests to the virtual IP address. The virtual router will reply even if it does not own the virtual IP address.

The AlliedWare Plus VRRPv3 implementation supports one IPv6 virtual link local address per virtual router ID. Note that in the command examples fe80::1 is an IPv6 link-local address. An IPv6 link-local address is used because IPv6 link-local addresses are used by IPv6 ND (Neighbor Discovery). A host's default route to a router points to the IPv6 link-local address, not a specific global IPv6 address for the router. For the host's traffic to switch over to a backup router, the IPv6 link-local address of the router is used by VRRPv3.

See the [VRRP Feature Overview and Configuration Guide](#) for more information about VRRPv3 IPv6 configuration details.

**Examples** The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 master:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 master
```

The example below shows you how to set the virtual IPv6 address for VRRPv3 VR ID 3 and the router as the VRRPv3 backup:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# virtual-ipv6 fe80::1 backup
```

The example below shows you disable the virtual IPv6 address for VRRPv3 VR ID 3:

```
awplus# configure terminal
awplus(config)# router ipv6 vrrp 3 vlan1
awplus(config-router)# no virtual-ipv6
```

**Related commands**

- [router ipv6 vrrp \(interface\)](#)
- [enable \(VRRP\)](#)
- [vrrp vmac](#)

## vrrp vmac

**Overview** Use this command to enable or disable the VRRP Virtual MAC feature. This feature is used by VRRP to make the hosts use the virtual MAC address as the physical hardware address of their gateway.

A VRRP router master will use the virtual MAC address for any ARP responses associated with the virtual IP address, or any gratuitous ARPs sent on behalf of the virtual IP address.

All VRRP advertisements are sent using this virtual MAC address as the source MAC address.

The virtual MAC address has the form 00:00:5e:00:01:<VRID>, where VRID is the ID of the Virtual Router.

**Syntax** `vrrp vmac {enable|disable}`

**Mode** Global Configuration

**Examples** To enable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac enable
```

To disable Virtual MAC enter:

```
awplus# configure terminal
awplus(config)# vrrp vmac disable
```

# debug epsr

**Overview** This command enables EPSR debugging.  
The **no** variant of this command disables EPSR debugging.

**Syntax** `debug epsr {info|msg|pkt|state|timer|all}`  
`no debug epsr {info|msg|pkt|state|timer|all}`

| Parameter | Description  |
|-----------|--|
| info      | Send general EPSR information to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above information from being sent to the console.                                |
| msg       | Send the decoded received and transmitted EPSR packets to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console.           |
| pkt       | Send the received and transmitted EPSR packets as raw ASCII text to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude the above packets from being sent to the console. |
| state     | Send EPSR state transitions to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude state transitions from being sent to the console.                                      |
| timer     | Send EPSR timer information to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude timer information from being sent to the console.                                      |
| all       | Send all EPSR debugging information to the console.<br>Using this parameter with the <b>no debug epsr</b> command will explicitly exclude any debugging information from being sent to the console.                      |

**Mode** Privileged Exec and Global Configuration

**Examples** To enable state transition debugging, use the command:

```
awplus# debug epsr state
```

To disable EPSR packet debugging, use the command:

```
awplus# no debug epsr pkt
```

**Related commands** [undebug epsr](#)

# epsr

**Overview** This command sets the timer values for an EPSR instance. These are only valid for master nodes.

**Syntax** `epsr <epsr-instance> {hellotime <1-32767>|failovertime <2-65535> ringflaptime <0-65535>}`  
`no epsr <epsr-instance>`

**CAUTION:** Using the no variant of this command will remove the specified EPSR instance.

| Parameter                                 | Description  |
|---|--|
| <code>&lt;epsr-instance&gt;</code>        | Name of the EPSR instance.   |
| <code>hellotime &lt;1-32767&gt;</code>    | The number of seconds between the transmission of health check messages.   |
| <code>failovertime &lt;2-65535&gt;</code> | The number of seconds that a master waits for a returning health check message before entering the failed state. <b>The failover time should be greater than twice the hellotime.</b> This is to force the master node to wait until it detects the absence of two sequential healthcheck messages before entering the failed state. |
| <code>ringflaptime &lt;0-65535&gt;</code> | The minimum number of seconds that a master must remain in the failed state.   |

**Mode** EPSR Configuration

**Examples** To set the hellotimer to 5 seconds for the EPSR instance called blue, use the command:

```
awplus(config-epsr)# epsr blue hellotime 5
```

**NOTE:** When stacking is used with EPSR, the EPSR **failovertime** should be at least 5 seconds.

To delete the EPSR instance called blue, use the command:

```
awplus(config-epsr)# no epsr blue
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [epsr configuration](#)
- [epsr datavlan](#)
- [epsr state](#)
- [epsr trap](#)

show epsr

# epsr configuration

**Overview** Use this command to enter EPSR Configuration mode so that EPSR can be configured.

**Syntax** `epsr configuration`

**Mode** Global Configuration

**Example** To change to EPSR mode, use the command:

```
awplus(config)# epsr configuration
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr](#)  
[show epsr](#)

# epsr datavlan

**Overview** This command adds a data VLAN or a range of VLAN identifiers to a specified EPSR instance.

The **no** variant of this command removes a data VLAN or data VLAN range from an EPSR instance.

**Syntax** `epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`  
`no epsr <epsr-instance> datavlan {<vlanid>|<vlanid-range>}`

| Parameter                          | Description  |
|------------------------------------|--|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.   |
| <code>datavlan</code>              | Adds a data VLAN to be protected by the EPSR instance.   |
| <code>&lt;vlanid&gt;</code>        | The VLAN's VID - a number between 1 and 4094 excluding the number selected for the control VLAN. |
| <code>&lt;vlanid-range&gt;</code>  | Specify a range of VLAN identifiers using a hyphen to separate identifiers.                      |

**Mode** EPSR Configuration

**Usage notes** We recommend you

- set the EPSR control VLAN to `vlan2`, using the [epsr mode master controlvlan primary port](#) and [epsr mode transit controlvlan](#) commands, then
- set the EPSR data VLAN between to be a value between 3 and 4094, using the [epsr datavlan](#) command.

**Examples** To add `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan3
```

To add `vlan2` and `vlan3` to the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue datavlan vlan2-vlan3
```

To remove `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan3
```

To remove `vlan2` and `vlan3` from the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue datavlan vlan2-vlan3
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# epsr enhancedrecovery enable

**Overview** This command enables EPSR's enhanced recovery mode. Enhanced recovery mode enables a ring to apply additional recovery procedures when a ring with more than one break partially mends. For more information, see the [EPSR Feature Overview and Configuration Guide](#).

The **no** variant of this command disables the enhanced recovery mode.

**Syntax** `epsr <epsr-instance> enhancedrecovery enable`  
`no epsr <epsr-instance> enhancedrecovery enable`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Default** Default is that enhanced recovery mode disabled.

**Mode** EPSR Configuration

**Example** To apply enhanced recovery on the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue enhancedrecovery enable
```

**Related commands** `show epsr`

# epsr flush-type

**Overview** Use this command to set how EPSR flushes Layer 2 entries when a topology change occurs. It can be configured to flush all Layer 2 entries on its EPSR interfaces or only flush the Layer 2 entries on its EPSR data VLANs.

Use the **no** variant of this command to revert to the default setting.

**Syntax** `epsr <epsr-name> flush-type {interface|vlan}`  
`no epsr <epsr-name> flush-type`

| Parameter   | Description  |
|-------------|--|
| <epsr-name> | The name of the EPSR instance to set the flush-type for.                             |
| interface   | Flush all Layer 2 entries from the EPSR interface on a topology change.              |
| vlan        | Flush the Layer 2 entries on the EPSR interface and data VLANs on a topology change. |

**Default** The default flush-type is vlan

**Mode** EPSR Configuration

**Usage notes** To flush all entries on the EPSR interface (including non-EPSR data VLANs) the flush-type command must be explicitly configured on the EPSR ring with the **interface** parameter.

Select **interface** as the flush-type to help reduce latency caused during EPSR topology changes. This type of flushing is quicker and less granular than flushing per data vlan, as flushing on a data **vlan** may incur a higher overhead, reducing EPSR responsiveness to ring topology changes.

Interface flushing can be used to optimize EPSR rings with a large number of VLANs. It will however also require relearning on any VLANs that are on an EPSR interface but not part of the EPSR configuration.

**Example** To configure the behavior of EPSR ring 'red' transit node on topology changes to flush all Layer 2 entries on its EPSR ring interfaces, use the following commands:

```
awplus# configure terminal
awplus(config)# epsr configuration
awplus(config-epsr)# epsr red mode transit controlvlan 10
awplus(config-epsr)# epsr red datavlan 20-29
awplus(config-epsr)# epsr red flush-type interface
awplus(config-epsr)# epsr red state enable
```

**Related commands** [show epsr](#)

**Command changes** Version 5.4.9-1.1: command added

# epsr mode master controlvlan primary port

**Overview** This command creates a master EPSR instance.

**NOTE:** This command will only run on switches that are capable of running as an EPSR master node. However, even if your switch cannot function as an EPSR master node, you still need to configure this command on whatever switch is the master within your EPSR network.

**Syntax** `epsr <epsr-instance> mode master controlvlan <2-4094>  
primaryport <port>`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.  |
| <code>mode</code>                  | Determines the node is acting as a master.  |
| <code>master</code>                | Sets switch to be the master node for the named EPSR ring.  |
| <code>controlvlan</code>           | The VLAN that will transmit EPSR control frames.  |
| <code>&lt;2-4094&gt;</code>        | VLAN id.  |
| <code>primaryport</code>           | Primary port for the EPSR instance.   |
| <code>&lt;port&gt;</code>          | The primary port. The port may be a switch port (e.g. port1.0.4) or a static channel group (e.g. sa3). It cannot be a dynamic (LACP) channel group. |

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.

**Mode** EPSR Configuration

**Example** To create a master EPSR instance called blue with vlan2 as the control VLAN and port1.0.1 as the primary port, use the command:

```
awplus(config-epsr)# epsr blue mode master controlvlan vlan2  
primaryport port1.0.1
```

**Related commands** [epsr mode transit controlvlan](#)  
[show epsr](#)

# epsr mode transit controlvlan

**Overview** This command creates a transit EPSR instance.

**Syntax** `epsr <epsr-instance> mode transit controlvlan <2-4094>`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.                                  |
| <code>mode</code>                  | Determines the node is acting as a transit node.            |
| <code>transit</code>               | Sets switch to be the transit node for the named EPSR ring. |
| <code>controlvlan</code>           | The VLAN that will transmit EPSR control frames.            |
| <code>&lt;2-4094&gt;</code>        | VLAN id.  |

**NOTE:** The software allows you to configure more than two ports or static channel groups to the control VLAN within a single switch or stacked node. However, we advise against this because in certain situations it can produce unpredictable results.

If the control VLAN contains more than two ports (or static channels) an algorithm selects the two ports or channels with the lowest number to be the ring ports. However if the switch has only one channel group is defined to the control vlan, EPSR will not operate on the secondary port.

EPSR does not support Dynamic link aggregation (LACP).

**Mode** EPSR Configuration

**Example** To create a transit EPSR instance called `blue` with `vlan2` as the control VLAN, use the command:

```
awplus(config-epsr)# epsr blue mode transit controlvlan vlan2
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# epsr priority

**Overview** This command sets the priority of an EPSR instance on an EPSR node. Priority is used to prevent “superloops” forming under fault conditions with particular ring configurations. Setting a node to have a priority greater than one turns on **superloop protection**.

The **no** variant of this command returns the priority of the EPSR instance back to its default value of 0, which also disables EPSR Superloop prevention.

**Syntax** `epsr <epsr-instance> priority <0-127>`  
`no <epsr-instance> priority`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.  |
| <code>priority</code>              | The priority of the ring instance selected by the <code>epsr-name</code> parameter.           |
| <code>&lt;0-127&gt;</code>         | The priority to be applied (0 is the lowest priority and represents no superloop protection). |

**Default** The default priority of an EPSR instance on an EPSR node is 0. The negated form of this command resets the priority of an EPSR instance on an EPSR node to the default value.

**Mode** EPSR Configuration

**Example** To set the priority of the EPSR instance called ‘blue’ to the highest priority (127), use the command:

```
awplus(config-epsr)# epsr blue priority 127
```

To reset the priority of the EPSR instance called ‘blue’ to the default (0), use the command:

```
awplus(config-epsr)# no epsr blue priority
```

**Related commands** [epsr configuration](#)

# epsr state

**Overview** This command enables or disables an EPSR instance.

**Syntax** `epsr <epsr-instance> state {enabled|disabled}`

| Parameter                          | Description                        |
|------------------------------------|------------------------------------|
| <code>&lt;epsr-instance&gt;</code> | The name of the EPSR instance.     |
| <code>state</code>                 | The operational state of the ring. |
| <code>enabled</code>               | EPSR instance is enabled.          |
| <code>disabled</code>              | EPSR instance is disabled.         |

**Mode** EPSR Configuration

**Usage notes** In a super-loop protection scenario, if you have:

- a device on the common segment acting as the master node for multiple EPSR rings,
- and you disable the rings and later re-enable them (e.g., when doing EPSR configuration changes),
- then you must re-enable the ring with the highest EPSR SLP priority **last**.

If you do not re-enable the rings in that order, the primary port may end up permanently in a blocking state. If the primary port does end up in a permanent blocking state, recover by disabling and re-enabling the EPSR ring that has the highest priority.

**Example** To enable the EPSR instance called 'blue', use the command:

```
awplus(config-epsr)# epsr blue state enabled
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)

# epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a “flush FDB” message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;epsr-name&gt;</code> | The name of the EPSR instance for which the topology-change applies to.   |
| <code>topology-change</code>   | The topology-change value to be set for the instance.   |
| <code>g8032</code>             | Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring. |

**Default** The default value is no notifications are accepted and in turn no “flush FDB” messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named “red” to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named “red” to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

**Related commands** `show epsr`

**Command changes** Version 5.4.7-1.1: command added

## epsr trap

**Overview** This command enables SNMP traps for an EPSR instance. The traps will be sent when the EPSR instance changes state.

The **no** variant of this command disables SNMP traps for an EPSR instance. The traps will no longer be sent when the EPSR instance changes state.

**Syntax** `epsr <epsr-instance> trap`  
`no epsr <epsr-instance> trap`

| Parameter                          | Description                      |
|------------------------------------|----------------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance.       |
| <code>trap</code>                  | SNMP trap for the EPSR instance. |

**Mode** EPSR Configuration

**Example** To enable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# epsr blue trap
```

To disable traps for the EPSR instance called `blue`, use the command:

```
awplus(config-epsr)# no epsr blue trap
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# show debugging epsr

**Overview** This command shows the debugging modes enabled for EPSR.

**Syntax** `show debugging epsr`

**Mode** User Exec and Privileged Exec

**Example** To show the enabled debugging modes, use the command:

```
awplus# show debugging epsr
```

**Related commands** [debug epsr](#)

# show epsr

**Overview** This command displays information about all EPSR instances.

**Syntax** show epsr

**Mode** User Exec and Privileged Exec

**Example** To show the current settings of all EPSR instances, use the command:

```
awplus# show epsr
```

**Output:** The following examples show the output display for a non-superloop topology network.  
**non-superloop topology**

**Table 1:** Example output from the **show epsr** command run on a transit node

```
-----
EPSR Information
-----
Name ..... test2
Mode ..... Transit
Status ..... Enabled
State ..... Links-Up
Control Vlan ..... 2

**Table 5:** Parameters displayed in the output of the **show epsr** command

| Parameter on Master Node | Parameter on Transit Node | Description   |
|--------------------------|---------------------------|---|
| Name                     | Name                      | The name of the EPSR instance.  |
| Mode                     | Mode                      | The mode in which the EPSR instance is configured - either Master or Transit  |
| Status                   | Status                    | Indicates whether the EPSR instance is enabled or disabled  |
| State                    | State                     | Indicates state of the EPSR instance's state machine. Master states are: Idle, Complete, and Failed. Transit states are Links-Up, Links-Down, and Pre-Forwarding. |
| Control Vlan             | Control Vlan              | Displays the VID of the EPSR instance's control VLAN.   |
| Data VLAN(s)             | Data VLAN(s)              | The VID(s) of the instance's data VLANs.  |
| Interface Mode           | Interface Mode            | Whether the EPSR instance's ring ports are both physical ports (Ports Only) or are both static aggregators (Channel Groups Only).                                 |
| Primary Port             | First Port                | The EPSR instance's primary ring port.  |

**Table 5:** Parameters displayed in the output of the **show epsr** command (cont.)

| Parameter on Master Node | Parameter on Transit Node | Description  |
|--------------------------|---------------------------|--|
| - Status                 | - Status                  | Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port because it does not have physical control of it.  |
|                          | - Direction               | The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"  |
| - Is On Common Segment   | - Is On Common Segment    | Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment.  |
| - Blocking Control       | - Blocking Control        | Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs.   |
| Secondary Port           | Second Port               | The EPSR instance's secondary port.  |
| - Status                 | - Status                  | Whether the ring port is forwarding (Forwarding) or blocking (Blocked), or has link down (Down), and if forwarding or blocking, "(logical)" indicates the instance has only logically set the blocking state of the port, because it does not have physical control of it. Note that on a master configured for SuperLoop Prevention (non-zero priority) its secondary ring port can be physically forwarding, but logically blocking. This situation arises when it is not the highest priority node in the topology (and so does not receive LINKS-DOWN messages upon common segment breaks) and a break on a common segment in its ring is preventing reception of its own health messages. |
|                          | - Direction               | The ring port on which the last EPSR control packet was received is indicated by "Upstream". The other ring port is then "Downstream"  |
| - Is On Common Segment   | - Is On Common Segment    | Whether the ring port is on a shared common segment link to another node, and if so, "(highest rank)" indicates it is the highest priority instance on that common segment   |
| - Blocking Control       | - Blocking Control        | Whether the instance has "physical" or "logical" control of the ring port's blocking in the instance's data VLANs  |
| Hello Time               |                           | The EPSR instance's setting for the interval between transmissions of health check messages (in seconds)   |
| Failover Time            |                           | The time (in seconds) the EPSR instance waits to receive a health check message before it decides the ring is down   |
| Ring Flap Time           |                           | The minimum time the EPSR instance must remain in the failed state   |
| Trap                     | Trap                      | Whether the EPSR instance has EPSR SNMP traps enabled  |

**Table 5:** Parameters displayed in the output of the **show epsr** command (cont.)

| Parameter on Master Node | Parameter on Transit Node | Description  |
|--------------------------|---------------------------|--|
| Enhanced Recovery        | Enhanced Recovery         | Whether the EPSR instance has enhanced recovery mode enabled |
| SLP Priority             | SLP Priority              | The EPSR instance's priority (for SuperLoop Prevention)      |

# show epsr common segments

**Overview** This command displays information about all the superloop common segment ports on the switch.

**Syntax** `show epsr common segments`

**Example** To display information about all the superloop common segment ports on the switch, use the command:

```
awplus# show epsr common segments
```

**Table 6:** Example output from the **show epsr common segments** command

| EPSR Common Segments    |                  |         |      |              |                       |                     |
|-------------------------|------------------|---------|------|--------------|-----------------------|---------------------|
| Common Seg<br>Ring Port | EPSR<br>Instance | Mode    | Prio | Port<br>Type | Phys Ctrl<br>of Port? | Ring<br>Port Status |
| port1.0.4               | test_inst_Red    | Transit | 127  | Second       | Yes                   | Fwding              |
|                         | test_inst_Blue   | Transit | 126  | Second       | No                    | Fwding (logical)    |
|                         | test_inst_Green  | Transit | 125  | First        | No                    | Fwding (logical)    |
| sa4                     | testA            | Master  | 15   | Primary      | Yes                   | Blocking            |
|                         | testB            | Transit | 14   | Second       | No                    | Fwding (logical)    |
| sa5                     | test_55          | Transit | 8    | First        | Yes                   | Down                |
|                         | test_77          | Transit | 7    | First        | No                    | Down                |

**Related commands**

- [show epsr](#)
- [show epsr summary](#)
- [show epsr counters](#)

# show epsr config-check

**Overview** This command checks the configuration of a specified EPSR instance, or all EPSR instances.

If an instance is enabled, this command will check for the following errors or warnings:

- The control VLAN has the wrong number of ports.
- There are no data VLANs.
- Some of the data VLANs are not assigned to the ring ports.
- The failover time is less than 5 seconds for a stacked device.
- The instance is a master with its secondary port on a common segment.

**Syntax** `show epsr [<instance>] config-check`

| Parameter  | Description                            |
|------------|--|
| <instance> | Name of the EPSR instance to check on. |

**Mode** User Exec and Privileged Exec

**Example** To check the configuration of all EPSR instances and display the results, use the command:

```
awplus# show epsr config-check
```

Table 58-1: Example output from **show epsr config-check**

| EPSR Instance | Status  | Description   |
|---------------|---------|---|
| red           | Warning | Failover time is 2s but should be 5s because device is stacked. |
| white         | OK.     |   |
| blue          | Warning | Primary port is not in data VLANs 29-99.                        |
| orange        | OK.     |   |

Don't forget to check that this node's configuration is consistent with all other nodes in the ring.

**Related commands** [show epsr](#)

# show epsr <epsr-instance>

**Overview** This command displays information about the specified EPSR instance.

**Syntax** `show epsr <epsr-instance>`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Mode** User Exec and Privileged Exec

**Example** To show the current settings of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue
```

**Related commands**

- `epsr mode master controlvlan primary port`
- `epsr mode transit controlvlan`
- `show epsr counters`

# show epsr <epsr-instance> counters

**Overview** This command displays counter information about the specified EPSR instance.

**Syntax** `show epsr <epsr-instance> counters`

| Parameter                          | Description                |
|------------------------------------|----------------------------|
| <code>&lt;epsr-instance&gt;</code> | Name of the EPSR instance. |

**Mode** User Exec and Privileged Exec

**Example** To show the counters of the EPSR instance called `blue`, use the command:

```
awplus# show epsr blue counters
```

**Related commands**

- [epsr mode master controlvlan primary port](#)
- [epsr mode transit controlvlan](#)
- [show epsr](#)

# show epsr counters

**Overview** This command displays counter information about all EPSR instances.

**Syntax** `show epsr counters`

**Mode** User Exec and Privileged Exec

**Example** To show the counters of all EPSR instances, use the command:

```
awplus# show epsr counters
```

**Related commands** [epsr mode master controlvlan primary port](#)  
[epsr mode transit controlvlan](#)  
[show epsr](#)

# show epsr summary

**Overview** This command displays summary information about all EPSR instances on the switch

**Syntax** show epsr summary

**Mode** User Exec and Privileged Exec

**Example** To display EPSR summary information, use the command:

```
awplus# show epsr summary
```

**Table 59:** Example output from the **show epsr summary** command

```
EPSR Summary Information

Abbreviations:
M = Master node

# cfm-sf-notify

**Overview** Use this command to configure this ERP instance to receive signal fail notifications from a Local MEP(s). This command can be used multiple times to allow multiple Local MEPs to be specified.

Use the **no** variant of this command to remove a Local MEP from sending notifications to this G.8032 ERP instance.

**Syntax** `cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`  
`no cfm-sf-notify mep mpid <mep-id> domain <domain-name> service <ma-name>`

| Parameter     | Description  |
|---------------|--|
| mep           | Specify that a Local Maintenance End Point (MEP) is to provide the Signal Fail notification to this G.8032 ERP instance. |
| mpid          | Specify that the Local MEP is to be identified by MEP-id.  |
| <mep-id>      | 1-8191. Specify the Local MEP's ID.  |
| domain        | Specify the Maintenance Domain that the Local MEP is associated with.  |
| <domain-name> | Specify the Maintenance Domain's CLI instance name.  |
| service       | Specify the Maintenance Association that the Local MEP is associated with.   |
| <ma-name>     | Specify the Maintenance Association's CLI instance name.   |

**Mode** G8032 Configure Switch

**Usage notes** CFM and Continuity Check Messaging (CCM) can be configured to detect link faults on the East or West interface ports as a whole, or faults on the R-APS VLAN on the East or West interface. In this situation CFM Local MEPs can notify G.8032 of defects it detects. G.8032 will treat these notifications as a Signal Fail (SF) for that East or West ring port. Similarly, CFM Local MEPs can notify G.8032 that the fault has cleared. When this command is used, this G.8032 ERP instance will ensure that the specified Local MEP is a Down MEP for the East or West interface used by this instance or for the R-APS VLAN on the East or West interface used by this instance.

**Example** To configure an ERP instance to receive signal fail notifications from a local MEP with an MEP ID of "12", an MD named "MD-INST1", and an MA named "MA-INST1-1", use the following commands:

```
awplus(config)# g8032 erp-instance ring2
awplus(g8032-config-switch)# cfm-sf-notify mep mpid 12 domain
MD-INST1 service MA-INST1-1
```

**Related commands**

- Version 5.4.7-1.1: added to x310 series products
- Version 5.4.7-2.1: added to x550 series products
- Version 5.4.8-0.2: added to SBx8100 series products
- Version 5.4.8-1.1: added to SBx908 GEN2 series products

# clear g8032 erp-instance

**Overview** Use this command to:

- trigger a reversion immediately, without waiting for timers to expire, or
- clear a forced-switch or manual-switch command that was previously successfully entered on a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `clear g8032 erp-instance <erp-instance-name>`

| Parameter                              | Description                         |
|--|-------------------------------------|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance |

**Mode** Privileged Exec

**Usage notes** This command can be used after a protection switch has occurred and the failure has cleared. If reversion is enabled, this command will trigger a reversion immediately, without having to wait for certain timers to expire (such as WTB or WTR). If reversion has been disabled, this command will trigger a reversion.

Alternatively, this command can be used on an ERP instance where a forced-switch or manual-switch command has been successfully entered to clear that action. The command will be ignored if a force-switch or manual-switch command had not been previously entered successfully, even if such node is in the FORCED\_SWITCH or MANUAL\_SWITCH state.

**Examples** To trigger a reversion immediately without waiting for a timer to expire on an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

Alternatively, to clear a previously applied forced-switch from an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue
```

The forced-switch would be created using a command like this one, which forces a protection switch on the East interface of an ERP instance named "blue":

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands** [g8032 erp-instance](#)

# clear g8032 erp-instance statistics

**Overview** Use this command to clear the statistics data being collected by a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `clear g8032 erp-instance <erp-instance-name> statistics`

| Parameter                              | Description                                |
|--|--|
| <code>&lt;erp-instance-name&gt;</code> | The name of a specific G.8032 ERP instance |

**Mode** Privileged Exec

**Usage notes** A G.8032 ERP instance keeps statistical data as counts on a variety of data such as the number of certain types of Ring-Automatic Protection Switching (R-APS) messages sent and received over its ring port(s) and error conditions detected. Use this command to clear the statistics data.

**Example** To clear the statistics for an ERP instance named "blue", use the following command:

```
awplus# clear g8032 erp-instance blue statistics
```

**Related commands** [g8032 erp-instance](#)

Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# data-traffic

**Overview** Use this command to add a data traffic VLAN or a range of VLANs to be protected by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove a data traffic VLAN or a range of VLANs.

**Syntax** `data-traffic <vid-list>`  
`no data-traffic <vid-list>`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;vid-list&gt;</code> | The data traffic VLAN ID(s). This can be a single VLAN ID, or can be a range of VLAN IDs separated by hyphen, or a comma separated list of VLAN IDs and ranges. Each VLAN ID can take on the range of 1 to 4094 |

**Mode** G8032 Configure Switch

- Usage notes**
- A G.8032 ERP instance can protect 0, 1 or more VLANs carrying data traffic.
  - This ERP instance must be associated with a physical ring instance.
  - Other ERP instances using the same physical ring instance are not allowed to have the same data traffic VLAN(s) as this ERP instance.
  - The data VLAN(s) must already exist.
  - The data VLAN(s)' port members should be members of the ring interface(s), but it is not enforced.
  - When a data traffic VLAN(s) is removed, any blocks that were in place on the ring ports for this VLAN(s) are removed. The user should make sure when removing the VLAN(s) from the ERP instance that a loop is not formed.
  - Data traffic VLAN(s) can be added or removed while the ERP instance is enabled or disabled.

**Example** To add a data traffic VLAN with a VLAN ID of "103" to an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# data-traffic 103
```

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# debug g8032

**Overview** Use this command to enable G.8032 debugging.  
Use the **no** variant of this command to disable G.8032 debugging.

**Syntax** `debug g8032 {all|event|rx|tx}`  
`no debug g8032 {all|event|rx|tx}`

| Parameter | Description                       |
|-----------|-----------------------------------|
| all       | Turn on all G.8032 debugging      |
| event     | Turn on G.8032 Event debugging    |
| rx        | Turn on G.8032 Receive debugging  |
| tx        | Turn on G.8032 Transmit debugging |

**Mode** Privileged Exec

**Example** To enable all G.8032 debugging, use the following command:

```
awplus# debug g8032 all
```

**Related commands** [show debugging](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# enable (g8032-profile)

**Overview** Use this command to change the revertive or non-revertive operation of the associated G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `enable {revertive|non-revertive}`

| Parameter                  | Description   |
|----------------------------|---|
| <code>revertive</code>     | This allows the ERP instance associated with this profile to operate in revertive mode.     |
| <code>non-revertive</code> | This allows the ERP instance associated with this profile to operate in non-revertive mode. |

**Default** By default, the mode of operation is revertive.

**Mode** G8032 Profile Configuration

**Usage notes** An ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. Once a ring failure has abated, a G.8032 ring instance will check its mode of operation, and if the mode is revertive, it will attempt to revert back to where the RPL-Owner controls the blocking of the ring. Otherwise, it operates in non-revertive mode.

**Example** To enable revertive mode for a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1
awplus(g8032-profile-config)# enable revertive
```

**Related commands** [g8032 profile](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# epsr topology-change

**Overview** Use this command to allow the given EPSR instance to accept notifications from other topology protocols, namely G.8032, for Topology Change Notifications (TCN).

Use the **no** variant of this command to return the EPSR instance to where it does not accept TCNs from the other specified protocol, and as a result does not send out a "flush FDB" message.

**Syntax** `epsr <epsr-name> topology-change g8032`  
`no epsr <epsr-name> topology-change g8032`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;epsr-name&gt;</code> | The name of the EPSR instance for which the topology-change applies to.   |
| <code>topology-change</code>   | The topology-change value to be set for the instance.   |
| <code>g8032</code>             | Specify that G.8032 is the other protocol that the topology-change notifications are allowed to be accepted from in order to send "flush FDB" messages to other EPSR nodes in the ring. |

**Default** The default value is no notifications are accepted and in turn no "flush FDB" messages are sent.

**Mode** EPSR Configuration

**Usage notes** The purpose of this command is to allow EPSR to accept notifications from other topology protocols, namely G.8032, about Topology Change Notifications (TCN). Once EPSR accepts the TCN, it will in turn notify the other nodes on the EPSR ring to perform an FDB flush.

**Example** To configure an EPSR instance named "red" to accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# epsr red topology-change g8032
```

To configure an EPSR instance named "red" to no longer accept G.8032 TCNs, use the following command:

```
awplus(config-epsr)# no epsr red topology-change g8032
```

**Related commands** [show epsr](#)

**Command changes** Version 5.4.7-1.1: command added

# erp-instance

**Overview** Use this command to enable or disable a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `erp-instance {enabled|disabled}`

| Parameter | Description                         |
|-----------|-------------------------------------|
| enabled   | The G.8032 ERP instance is enabled  |
| disabled  | The G.8032 ERP instance is disabled |

**Default** The ERP instance is disabled.

**Mode** G8032 Configure Switch

**Usage notes** Once a G.8032 ERP instance has been configured with the correct parameter settings or defaults, it can be enabled to run the G.8032 protocol. To change certain ERP instance parameters, the instance may need to be disabled.

When enabled, the instance is restarted back to the G8032\_ST\_INIT state. In this state, if the node has an RPL-Owner or RPL-Neighbor port, it will be blocked. Otherwise the node will block one of its ring ports. All the nodes will send Ring-Automatic Protection Switching (R-APS) messages initially. The G.8032 protocol and state machines will transition the ring into another more appropriate state.

When disabled, the ERP instance will no longer process incoming R-APS messages for that instance, nor send any R-APS messages. The raps-channel VLAN and any data-traffic VLANs used by this instance will be put in the forwarding state for its physical ring ports. Caution should be taken to avoid loops when disabling an ERP instance.

**Example** To enable an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# erp-instance enabled
```

# g8032 erp-instance

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance, or to enter an existing instance's context.

Use the **no** variant of this command to destroy the specified instance.

**Syntax** `g8032 erp-instance <erp-instance-name>`  
`no g8032 erp-instance <erp-instance-name>`

| Parameter                              | Description   |
|--|---|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance. This can be up to 32 characters. |

**Mode** Global Configuration

**Usage notes** The ERP protocol in AlliedWare Plus™ can run one or more instances. A G.8032 ERP instance is made up of:

- two ERP ring ports,
- a Control VLAN that carries Ring-Automatic Protection Switching (R-APS) messages, and
- zero, one, or more Protected traffic data VLANs that the instance protects when the ring fails.

An ERP instance must be associated with a G.8032 physical ring and a G.8032 profile.

**Example** To enter the context of an instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)#
```

# g8032 forced-switch erp-instance

**Overview** Use this command to force a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** `g8032 forced-switch erp-instance <erp-instance-name>  
{east-interface|west-interface|terminating-interface}`

| Parameter                              | Description                                     |
|--|---|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance             |
| <code>east-interface</code>            | The G.8032 ERP instance's East ring port        |
| <code>west-interface</code>            | The G.8032 ERP instance's West ring port        |
| <code>terminating-interface</code>     | The G.8032 ERP instance's Terminating ring port |

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Forced Protection Switch action initiated by the operator. A Forced Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Forced Switch message to flow around the ring causing the RPL to become unblocked.

Multiple Forced Switch actions can take place along a G.8032 ring. Care must be taken when using the Force Switch command as it can only be undone by issuing a Clear command and not by a failure nor the clearing of a failure. If a node that was issued a Force Switch command later fails, then it becomes difficult to remove the Force Switch condition from the ring. In this situation, the operator has to go to the nodes that are adjacent to the failed node, and for each one, issue a Forced Switch command on the ring link facing the failed node followed by a Clear command.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the [clear g8032 erp-instance](#) command.

**Example** To issue a Forced Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 forced-switch erp-instance blue east-interface
```

**Related commands** [clear g8032 erp-instance](#)  
[g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products

Version 5.4.7-2.1: added to x550 series products

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# g8032 manual-switch erp-instance

**Overview** Use this command to manually cause a protection switch on a G.8032 Ethernet Ring Protection (ERP) instance ring port.

**Syntax** `g8032 manual-switch erp-instance <erp-instance-name>  
{east-interface|west-interface|terminating-interface}`

| Parameter                              | Description                                     |
|--|---|
| <code>&lt;erp-instance-name&gt;</code> | The name of the G.8032 ERP instance             |
| <code>east-interface</code>            | The G.8032 ERP instance's East ring port        |
| <code>west-interface</code>            | The G.8032 ERP instance's West ring port        |
| <code>terminating-interface</code>     | The G.8032 ERP instance's Terminating ring port |

**Mode** Privileged Exec

**Usage notes** G.8032 supports a Manual Protection Switch action initiated by the operator. A Manual Protection Switch command is to be issued at a given G.8032 node and given port in the ring. This results in a block being applied at that ring port (and an unblock on the opposite ring port), and a R-APS designated Manual Switch message to flow around the ring causing the RPL to become unblocked.

The difference between a Manual switch and a Forced switch is that the Manual Switch will be ignored under various conditions. In particular, only one Manual Switch is allowed on a G.8032 ring at a time.

If the G.8032 Physical Ring instance associated with the specified ERP instance is set to terminating-interface, then only one ring port is available and terminating-interface must be used in this command, otherwise specify the east-interface or the west-interface.

To clear this action command, use the [clear g8032 erp-instance](#) command.

**Example** To issue a Manual Protection Switch on the East interface of an ERP instance named "blue", use the following command:

```
awplus# g8032 manual-switch erp-instance blue east-interface
```

**Related commands** [clear g8032 erp-instance](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# g8032 physical-ring

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) physical ring profile which specifies the Ethernet ports that will be used as G.8032 ring ports.

**Syntax** `g8032 physical-ring <physical-ring-name> {east-interface <interface-name1> west-interface <interface-name2>| terminating-interface <interface-name>}`  
`no g8032 physical-ring <physical-ring-name>`

| Parameter                               | Description   |
|---|---|
| <code>&lt;physical-ring-name&gt;</code> | The name of the profile (up to 37 characters)   |
| <code>east-interface</code>             | The East G.8032 ring port   |
| <code>&lt;interface-name1&gt;</code>    | The name of the switch interface, either port or channel group, for the East ring port. It must differ from the West ring port. |
| <code>west-interface</code>             | The West G.8032 ring port   |
| <code>&lt;interface-name2&gt;</code>    | The name of the switch interface, either port or channel group, for the West ring port. It must differ from the East ring port. |
| <code>terminating-interface</code>      | The Terminating ring port. This should only be used for G.8032 ERP instance that is at the end of a sub-ring.                   |
| <code>&lt;interface-name&gt;</code>     | The name of the switch interface, either port or channel group, for the Terminating ring port.                                  |

**Mode** Global Configuration

**Usage notes** Each ERP instance will be associated with a physical ring profile. A physical ring profile is made up of two physical Ethernet ports or aggregated interfaces, unless it is the terminating point of a sub-ring in which case only one port is needed. When two ports are used, they are referred to as East and West ports. When only a single port is used, it is referred to as a Terminating port.

**Example** To create a physical ring profile named "red" where the East interface port is port1.0.4 and the West interface port is port1.0.8, use the following commands:

```
awplus# configure terminal
awplus(config)# g8032 physical-ring red east-interface
port1.0.4 west-interface port1.0.8
```

# g8032 profile

**Overview** Use this command to create a G.8032 Ethernet Ring Protection (ERP) instance profile, or to enter that instance's profile context.

Use the **no** variant of this command to destroy the specified instance.

**Syntax** `g8032 profile {<erp-profile-name>|default-profile}`  
`no g8032 profile <erp-profile-name>`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;erp-profile-name&gt;</code> | The name of the G.8032 profile. This can be up to 32 characters.   |
| <code>default-profile</code>          | The name of the system's default profile for G.8032. This profile is created by the system automatically and can not be destroyed. |

**Default** A profile with the name "default-profile" will exist in the system and is used by default by an ERP instance. All the parameters in the default profile take on the default values.

**Mode** Global Configuration

**Example** To enter the context of a profile named "prof\_1", use the following commands:

```
awplus(config)# g8032 profile prof_1  
awplus(g8032-profile-config)#
```

**Related commands** [enable \(g8032-profile\)](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# level (g8032-switch)

**Overview** Use this command to configure the level for Ring-Automatic Protection Switching (R-APS) messages.

**Syntax** level <0-7>

| Parameter | Description                                |
|-----------|--|
| <0-7>     | The level used by the G.8032 ERP instance. |

**Default** The default level is 0.

**Mode** G8032 Configure Switch

**Usage notes** Inside the R-APS messages is the Level field. The G.8032 Ethernet Ring Protection (ERP) instance will use the configured level for sending R-APS messages, and is the level that the instance expects to receive. If the node receives an R-APS message with the improper level then the message will not be processed.

The ERP instance must be disabled to change the level, otherwise the setting is denied.

**Example** To set the R-APS message level field for an ERP instance named "blue" to 3, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# level 3
```

**Related commands** [g8032 erp-instance](#)

Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# physical-ring

**Overview** Use this command to specify which G.8032 physical ring instance is to be used by this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `physical-ring <physical-ring-name>`

| Parameter                               | Description                             |
|---|---|
| <code>&lt;physical-ring-name&gt;</code> | The name of the physical ring instance. |

**Mode** G8032 Configure Switch

**Usage notes** A G.8032 ERP instance in general has two ring ports, unless it is at the end of a sub-ring in which case it has only one ring port. Ring port(s) are specified using a G.8032 physical ring instance.

This command can only be accepted when the ERP instance is disabled.

**Example** To configure an ERP instance named "blue" to use a physical ring instance named "red", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# physical-ring red
```

# profile name

**Overview** Use this command to associate a G.8032 profile instance with this G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** `profile name <erp-profile-name>`

| Parameter                             | Description                    |
|---------------------------------------|--------------------------------|
| <code>&lt;erp-profile-name&gt;</code> | The name of the G.8032 profile |

**Default** If this command is not used, a profile with the name "default-profile" will be used for this G.8032 ERP instance.

**Mode** G8032 Configure Switch Mode

**Usage notes** A G.8032 ERP instance uses a profile which contains timer configurations and configurations for revertive modes of operation. This configuration can be accepted regardless of the ERP instance being disabled or enabled. Any parameters from a changed profile will take effect the next time the G.8032 state machine uses the parameters in the updated profile.

**Example** To associate a G.8032 profile named "prof\_1" with a G.8032 ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# profile name prof_1
```

# raps-channel

**Overview** Use this command to specify which VLAN to use as a channel for G.8032 Ring-Automatic Protection Switching (R-APS) messages sent and received by this G.8032 Ethernet Ring Protection (ERP) instance.

Use the **no** variant of this command to remove the VLAN from being used as the R-APS channel VLAN.

**Syntax** `raps-channel <vid>`  
`no raps-channel`

| Parameter                | Description                              |
|--------------------------|--|
| <code>&lt;vid&gt;</code> | A single VLAN-id in the range 2 to 4094. |

**Mode** G8032 Configure Switch

**Usage notes** For a G.8032 ERP instance, a VLAN is used as a channel for carrying an R-APS message. This VLAN is also used to identify the proper ring instance to all the other nodes in the ring.

The VLAN must be tagged members of the G.8032 physical ring instance associated with this ERP instance. A G.8032 physical ring instance must be associated with this ERP instance. The ERP instance can not be enabled until this raps-channel VLAN has been configured properly.

The ERP instance must be disabled when using the **no** variant.

**Example** To configure a VLAN with a VLAN-id of "103" as a R-APS channel for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# raps-channel 103
```

**Related commands** [g8032 erp-instance](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# service onm

**Overview** Use this command to enable the ONM service, which underlies CFM and G.8032. Use the **no** version of the command to disable the unused ONM service.

**Syntax** `service onm`  
`no service onm`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** Disabling the service can reduce memory usage on the switch, particularly when many VLANs are configured on ports.

Disabling the service will only take effect after you save the configuration and restart the device.

**Example** To disable the ONM service, use the commands:

```
awplus# configure terminal
awplus(config)# no service onm
```

**Output** Figure 59-1: Example output from **no service onm**

```
awplus(config)#no service onm
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-2.1: command added

# rpl role

**Overview** Use this command to specify the role of each G.8032 Ethernet Ring Protection (ERP) ring port (also known as a link). The role can be specified as to whether it is a Ring Protection Link (RPL) or not, and if it is an RPL, whether it is the Owner or Neighbor end of an RPL.

Use the **none** variant of this command to set all the ERP instance's ring ports' RPL role to **none**.

**Syntax** `rpl role {owner|neighbor}{east-interface|west-interface|terminating-interface}`  
`rpl role none`

| Parameter             | Description  |
|-----------------------|--|
| owner                 | This sets the specified ring port to be an RPL Owner           |
| neighbor              | This sets the specified ring port to be an RPL Neighbor        |
| east-interface        | The ring port's east-interface.                                |
| west-interface        | The ring port's west-interface.                                |
| terminating-interface | The ring port's terminating-interface                          |
| none                  | This sets all the ERP instance's ring ports' RPL role to none. |

**Default** A RPL role of "none" is the default.

**Mode** G8032 Configure Switch

**Usage notes** If a node has one of its ring ports set to Owner or Neighbor, then **none** is automatically set on any other ring port as **none** is the only possible setting for the other ring port.

When using this command to set the RPL role to **none**, an interface need not be specified, as this command will set all the ring ports RPL role to **none**.

The command can only be accepted when the G.8032 ERP Instance is disabled, and the ERP instance must also have an association to a ERP Physical Ring instance.

As in the case of a sub-ring with only one physical ring port, use **terminating-interface** when specifying the RPL role as Owner or Neighbor.

**Example** To configure the east-interface of a ring port named "blue" to be an RPL Owner, use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# rpl role owner east-interface
```

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command.

| Parameter                       | Description   |
|---------------------------------|---|
| Instance name                   | The configured <erp-instance-name> for this instance.   |
| Admin State                     | The configured administrative state of this instance, either enabled or disabled. When the ERP instance is disabled, all dynamic data for other parameters in this table will be shown as "-", except for the East Link or West Link which will show the last known block or unblocked state. |
| G.8032 State                    | A dynamic parameter showing the current state of the instance per the G.8032 state machine. If the ERP Instance is disabled, it will be in the INIT state.  |
| Phy Ring                        | Shows the Physical Ring Instance name that this ERP Instance is associated with along with the East/West or Terminating Interface used by the Physical Ring Instance.   |
| East Link or West Link          | A dynamic variable showing whether the instance's ring port and its VLANs are blocked or not. In the special case of an interconnection node where a sub-ring terminates, both the East Link and the West Link are the same.  |
| RPL Role East Link or West Link | Shows the configuration of the link's role.   |

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

| Parameter            | Description   |
|----------------------|---|
| CFM MEP East or West | Identifies the configured MEP, if any, that is being used to provide a CFM based Signal Fail indication to this instance. The MEP is identified by its direction (Up or Down), its MEP-id, and the Maintenance Domain (MD) and Maintenance Association (MA) it is associated with by name.  |
| ERP Profile          | Identifies the ERP Profile instance that was configured for use by this ERP Ring instance.  |
| Level                | The Level that was configured for R-APS messages that are used by this ERP Ring instance.   |
| Ring-ID              | The Ring-ID that is to be used by this ERP instance.  |
| RAPS-Channel VLAN    | The VLAN-id that is configured used for sending and receiving R-APS messages for this ERP instance.   |
| Sub-ring             | Specifies whether the ring is operating as a Sub-ring or otherwise as a Major ring.   |
| Virtual Channel      | Specifies whether the sub-ring is operating with a virtual channel or not.  |
| Data Traffic VLANs   | A comma-separated list of configured VLAN-ids (individually, or range) that are used for data-traffic and protected by this ERP instance.   |
| TCN To Inst          | A comma-separated list of protocols and their instances that are to be notified when a Topology Change Notification occurs for this ERP instance. This only applies to a sub-ring with a Terminating interface and in which case "-" will be displayed if no target instances have been identified. Otherwise a "-" is displayed anyway. Identifies the protocol to notify. Only "G8032" will be supported initially. <instance-name> - Identifies the instance to notify for the given protocol. |
| TCN Flush Event      | Specifies if this instance as a target instance is to send out Flush FDB messages upon TCN notifications by a detecting instance. Identifies the notifying protocol allowed. Only "G8032" will be supported initially. If no protocols have been configured then display "-".   |
| SNMP Traps           | Indicates whether SNMP traps have been enabled or disabled for this ERP instance.   |

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

| Parameter           | Description  |
|---------------------|--|
| Signal Fail         | Indicates whether a Signal Fail condition is being received over the East or West ring interface. <signal-fail> consists of:<br>"-" no Signal Fail is being indicated<br>"Link" - indicates the interface port or LAG has gone operationally down.<br>"CFM MEP <mep-id>" - indicates that a local CFM MEP has indicated a Signal Fail, and which MEP by mep-id.  |
| Failure of Protocol | Indicates that there are defects in the receipt of an R-APS message. There are the following types:<br>FOP-PM (Provisioning Mismatch) - "true" indicates per G.8032, that the RPL-Owner is receiving R-APS(NR, RB) messages with a node-id not of itself. In addition, since the initial implementation does not support version 1, any R-APS messages with version 1 will also indicate a FOP-PM error. The FOP-PM error can occur on an East or a West Port.<br>FOP-TO (Time Out) - "true" indicates that a node has not received an R-APS message on any of its ring ports for 3.5 times the R-APS message interval even though one or both ring ports are capable of receiving R-APS messages (no SF, Admin Up). |
| Version             | The version of the R-APS message that is being received or sent over the East or West ring interface. An R-APS message version of "1" corresponds to G.8032 version 2.   |
| Request             | Indicates the protection switch request being sent or received in the R-APS message. Consists of one of: NR - No Request for protection switching SF - Signal Fail MS - Manual Switch request FS - Force Switch request Event - Request a Flush to be performed. Note this is a transient condition.   |
| RPL Block           | Indicates whether the RPL is being blocked or not. consists of one of the following: "RB" - RPL Block is being applied by the RPL-Owner. "-" - No RPL Block is being applied by the RPL-Owner, or the R-APS message originated from a non-RPL-Owner.   |
| DNF                 | Indicates the value of the Do Not Flush bit in the R-APS message. The value is either "0" or "1".  |
| Block Port Ref      | Block Port Reference refers to the node's East or West port that is being blocked and shows as "0" or "1" in accordance to G.8032.   |
| Node-ID             | The MAC address of this Node or the MAC address used in sending/receiving R-APS messages.  |

**Table 1:** Parameters in the output from the **show g8032 erp-instance** command. (cont.)

| Parameter                    | Description  |
|------------------------------|--|
| East Sending or West Sending | If this local node is not sending R-APS, then all the fields are shown as "-"  |
| Timers                       | Wait-to-Restore - "Running" indicates this timer is active, otherwise is "-".Wait-to-Block - "Running" indicates this timer is active, otherwise is "-".Hold Off Timer - "Running" indicates this timer is active, otherwise is "-". |

# show g8032 physical-ring

**Overview** Use this command to show the G.8032 physical ring instance information.

**Syntax** `show g8032 physical-ring {<physical-ring-name>|all}`

| Parameter            | Description  |
|----------------------|--|
| <physical-ring-name> | The name of the physical ring                                    |
| all                  | This shows all physical ring instances that have been configured |

**Mode** User Exec and Privileged Exec

**Example** To show the details of a physical ring instance named "red", use the following command:

```
awplus# show g8032 physical-ring red
```

**Output** Figure 59-5: Example output from the **show g8032 physical-ring** command.

```
awplus#show g8032 physical-ring red
Ring : red
=====
East   : port1.0.4
West   : port1.0.8
ERP Inst : blue
```

**Table 3:** Parameters in the output from the **show g8032 physical-ring** command.

| Parameter               | Description  |
|-------------------------|--|
| Ring                    | The name of the physical ring that was configured for this physical ring instance.   |
| East, West, Terminating | The physical interface port or LAG of the East or West Ring interface, or the Terminating interface that was configured for this physical ring instance. |
| ERP Inst                | A comma-separated list of ERP instances by name that have been configured to use this physical ring instance, or "-" if none.                            |

# show g8032 profile

**Overview** Use this command to show one specific G.8032 profile or all G.8032 profiles, and the configured information within each profile.

**Syntax** `show g8032 profile {<erp-profile-name>|default-profile|all}`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;erp-profile-name&gt;</code> | The name of the G.8032 profile that was created by the user.                         |
| <code>default-profile</code>          | The default name of the G.8032 profile that was created automatically by the system. |
| <code>all</code>                      | Using this will show all G.8032 profiles.  |

**Mode** User Exec and Privileged Exec

**Example** To show the profile details for a profile named "prof1", use the following command:

```
awplus# show g8032 profile prof1
```

**Output** Figure 59-6: Example output from the **show g8032 profile** command.

```
awplus#show g8032 profile prof1
Profile : prof1
=====
Wait-To-Restore : 5 mins
Hold Off Timer  : 0 ms
Guard Timer     : 500 ms
Wait-To-Block   : 5500 ms
Protection Type : Revertive
ERP Inst        : blue
```

**Table 4:** Parameters in the output from **show g8032 profile** command.

| Parameter       | Description  |
|-----------------|--|
| Wait-To-Restore | The configured value in <1-12> minutes.  |
| Hold Off Timer  | The configured value but shown instead in milliseconds which ranges from 0 to 10,000 (10s) in 100 ms increments. |
| Guard Timer     | The configured value which ranges from 10 to 2000 in 10 ms increments.   |

**Table 4:** Parameters in the output from **show g8032 profile** command. (cont.)

| Parameter     | Description   |
|---------------|---|
| Wait-To-Block | 5 seconds more than the configured Guard Time. The range is 5010 to 5200.           |
| ERP Inst      | Comma separated list of ERP instances using this profile, or "-" if there are none. |

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# sub-ring

**Overview** Use this command to configure the mode of operation for the G.8032 Ethernet Ring Protection (ERP) instance as a sub-ring.

Use the **no** variant of this command to change the mode of operation to that of a normal fully enclosed ring.

**Syntax** `sub-ring`  
`no sub-ring`

**Default** By default the mode is **no sub-ring**.

**Mode** G8032 Configure Switch

**Usage notes** An ERP instance can operate normally as a fully enclosed ring, commonly called a major ring, or as a partially enclosed ring, called a sub-ring. Sub-rings must be attached to either a major ring (one that is fully closed) or to other sub-rings where one of the other sub-rings itself is attached to a major ring.

Setting the mode to sub-ring should also be set for all nodes in the sub-ring, as the G.8032 state machine is different from that of a major ring.

This configuration can only be accepted when the ERP instance is disabled.

When the physical ring instance used by this ERP instance is configured for terminating interface, then this ERP instance will automatically be configured to be in the sub-ring mode and can not be changed.

**Example** To configure an ERP instance named "blue" as a sub-ring, use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# sub-ring
```

**Related commands** [g8032 erp-instance](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# timer (g8032-profile)

**Overview** Use this command to configure a timer for a specified G.8032 Ethernet Ring Protection (ERP) instance profile.

**Syntax**

```
timer wait-to-restore {<1-12>|default}  
timer hold-off {<0-100>|default}  
timer guard-timer {<1-200>|default}
```

| Parameter       | Description   |
|-----------------|---|
| wait-to-restore | This timer is used to soak signal failure abatement to ensure the signal failure abatement is not intermittent. This timer is only used by the RPL Owner when in the revertive operation, and thus is attempting to restore the ring. It is configurable in steps of 1 to 12 minutes (default is 5 minutes).  |
| hold-off        | This timer allows any other underlying protection schemes to recover before G.8032 reacts to its defect as this gives time for the G.8032 defect to clear. A classic example is when the ERP Physical ring port is carried over a SONET/SDH transmission system that itself has 50ms recovery times. If G.8032 detects a failure, then increasing this timer to some value greater than 50ms would allow the SONET/SDH system to recover and have the defect that G.8032 detected disappear thus preventing the need for G.8032 to try and recover. The Hold Off timer is configurable in 0 to 10 seconds in steps of 100ms (default is 0 ms).  |
| guard-timer     | This is the amount of time that an ERP instance discards most R-APS messages before being allowed to process them. It is used when a clearing condition occurs yet at the same time older messages are still propagating around the ring with failure indications. For example two nodes that just noticed a link failure abatement condition could start clearing and almost immediately one of them could receive an old Signal Fail indication message from the other node (that was still in flight) which in turn causes the receiving node to react to the Signal Fail inadvertently. This timer is particularly useful where R-APS propagation time through the ring is large. Refer to ITU-T G.8032 for more information. The Guard timer is configurable in 10ms steps between 10ms and 2 seconds (default is 50 for 500ms). |

**Mode** G8032 Profile Configuration

**Example** To set the wait-to-restore timer of a profile named "prof\_1" to a value of 1 minute, use the following commands:

```
awplus(config)# g8032 profile prof_1  
awplus(g8032-profile-config)# timer wait-to-restore 1
```

**Related commands** [g8032 profile](#)  
[show g8032 profile](#)

**Command changes** Version 5.4.7-0.1: command added  
Version 5.4.7-1.1: added to x310 series products  
Version 5.4.7-2.1: added to x550 series products  
Version 5.4.8-0.2: added to SBx8100 series products  
Version 5.4.8-1.1: added to SBx908 GEN2 series products

# topology-change

**Overview** Use this command to enable this G.8032 Ethernet Ring Protection (ERP) instance to send a Flush Event message after notification of a Topology Change Notification (TCN) by a detecting instance.

Use the **no** variant of this command to disable the sending of the Flush Event.

**Syntax** topology-change {g8032}  
no topology-change {g8032}

| Parameter | Description   |
|-----------|---|
| g8032     | Specify that G.8032 is the protocol that is affected by this command. |

**Default** Topology change is enabled by default for G.8032.

**Mode** G8032 Configure Switch

**Usage notes** If this ERP instance is on an interconnecting node, then the ERP instance may need to be notified of a topology change that occurred in another G.8032 sub-ring attached to this node. The former will be termed the "target" ERP instance, and the latter the "detecting" ERP instance.

The criteria for notification is:

- the detecting ERP instance is configured as a sub-ring with a Terminating interface,
- it is protecting the same data VLANs as the target instance, and
- the target ERP instance must have two ring ports.

When the detecting ERP instance detects a topology change on its sub-ring, AlliedWare Plus™ will automatically determine which target ERP instance(s) needs to be notified. It does this by comparing the same data VLANs in the detecting ERP instance with all the other instances.

If target ERP instances are identified and these instances also have both an East and a West interface configured, then those target instances are notified. Upon notification, the target ERP instance has a couple of actions that it has to perform:

- To flush the FDB on both its East and West interfaces for the protected VLANs.
- To send out an R-APS flush event message over its East and West interfaces. The flush event message is sent around the target ring and each node on the target ring will perform an FDB flush of its protected VLANs. The sending of a R-APS flush event may not be needed in some cases and as such it is configurable.

**Example** To enable sending of R-APS flush event messages on an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue  
awplus(g8032-config-switch)# topology-change g8032
```

# trap (g8032-switch)

**Overview** Use this command to enable or disable SNMP traps for a G.8032 Ethernet Ring Protection (ERP) instance.

**Syntax** trap {enabled|disabled}

| Parameter | Description                                      |
|-----------|--|
| enabled   | Enable this ERP instance to generate traps.      |
| disabled  | Disable this ERP instance from generating traps. |

**Default** The SNMP traps for the ERP instance are enabled.

**Mode** G8032 Configure Switch

**Usage notes** Globally, ERP traps are disabled by default but can be enabled globally using the [snmp-server enable trap](#) command.

**Example** To disable the SNMP traps for an ERP instance named "blue", use the following commands:

```
awplus(config)# g8032 erp-instance blue
awplus(g8032-config-switch)# trap disabled
```

**Related commands** [erp-instance](#)  
[show g8032 erp-instance](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# undebug g8032

**Overview** Use this command to turn off debugging for various G.8032 debug attributes.

**Syntax** `undebug g8032 {all|event|rx|tx}`

| Parameter | Description                          |
|-----------|--------------------------------------|
| all       | All G.8032 debugging                 |
| event     | G.8032 debugging events              |
| rx        | G.8032 debugging Receive activities  |
| tx        | G.8032 debugging Transmit activities |

**Mode** Privileged Exec

**Example** To turn off all G.8032 debugging, use the following command:

```
awplus# undebug g8032 all
```

**Related commands** [debug g8032](#)  
[show debugging g8032](#)

Version 5.4.8-1.1: added to SBx908 GEN2 series products

# Part 7: Network Management

# 60

# Allied Telesis Management Framework™ (AMF) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for Allied Telesis Management Framework™ (AMF) commands.

**AMF master nodes** Every AMF network must have at least one master node, which acts as the core of the AMF network. Not all AlliedWare Plus devices are capable of acting as an AMF master. See the [AMF Feature Overview and Configuration Guide](#) for information about AMF master support.

**AMF edge** AlliedWare Plus CentreCOM® Series switches can only be used as edge switches in an AMF network. The full management power and convenience of AMF is available on these switches, but they can only link to one other AMF node. They cannot form cross-links or virtual links.

**AMF naming convention** When AMF is enabled on a device, it will automatically be assigned a host name. If a host name has already been assigned, by using the command [hostname](#) on page 306, this will remain. If however, no host name has been assigned, then the name applied will be the prefix, **host\_** followed (without a space) by the MAC address of the device. For example, a device whose MAC address is **0016.76b1.7a5e** will have the name **host\_0016\_76b1\_7a5e** assigned to it.

To efficiently manage your network using AMF, we strongly advise that you devise a naming convention for your network devices, and apply an appropriate hostname to each device in your AMF network.

**AMF and STP** On AR-Series UTM firewalls and Secure VPN routers, you cannot use STP at the same time as AMF.

# application-proxy ip-filter

**Overview** Use this command to enable global IP filtering on a device. Once enabled the device will add a global ACL in response to a threat message from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable global IP filtering.

**Syntax** `application-proxy ip-filter`  
`no application-proxy ip-filter`

**Default** Global IP filtering is disabled by default.

**Mode** Global Configuration

**Usage notes** For this feature to work, the AMF Application Proxy service needs to be enabled on your network, using the command [service atmf-application-proxy](#).

**Example** To enable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy ip-filter
```

To disable global IP filtering, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy ip-filter
```

**Related commands** [application-proxy redirect-url](#)  
[application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.5: command added

# application-proxy quarantine-vlan

**Overview** Use this command to set the quarantine VLAN to use when an AMF Security (AMF-Sec) Controller detects a threat. The port/s on which the threat is detected are moved to this VLAN if the [application-proxy threat-protection](#) action is set to **quarantine**.

Use the **no** variant of this command to delete the quarantine VLAN. If no quarantine VLAN is specified then no quarantine action will be performed.

**Syntax** `application-proxy quarantine-vlan <vlan-id>`  
`no application-proxy quarantine-vlan`

| Parameter                    | Description                                     |
|------------------------------|---|
| <code>&lt;vlan-id&gt;</code> | The ID of the VLAN to use. In the range 1-4094. |

**Default** By default, no quarantine VLAN is configured.

**Mode** Global Configuration

**Example** To configure VLAN 100 as the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy quarantine-vlan 100
```

To delete the quarantine VLAN, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy quarantine-vlan
```

**Related commands** [application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[application-proxy threat-protection send-summary](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# application-proxy redirect-url

**Overview** Use this command to redirect a user to a helpful URL when they are blocked because of an [application-proxy ip-filter](#).

Use the **no** variant of this command to remove the URL redirect.

**Syntax** `application-proxy redirect-url <url>`  
`no application-proxy redirect-url`

| Parameter                | Description                  |
|--------------------------|------------------------------|
| <code>&lt;url&gt;</code> | URL to redirect the user to. |

**Default** No URL is configured by default.

**Mode** Global Configuration

**Example** To configure a redirect URL, use the command:

```
awplus# application-proxy redirect-url http://my.dom/help.html
```

To remove a redirect URL, use the command:

```
awplus# no application-proxy redirect-url
```

**Related commands** [application-proxy ip-filter](#)  
[application-proxy threat-protection](#)  
[clear application-proxy threat-protection](#)  
[service atmf-application-proxy](#)  
[show application-proxy threat-protection](#)

**Command changes** Version 5.4.9-0.1: command added

# application-proxy threat-protection

**Overview** Use this command to set the blocking action to take when a threat detected message is received from an AMF Security (AMF-Sec) Controller.

Use the **no** variant of this command to disable threat protection blocking actions on the port.

**Syntax** application-proxy threat-protection {drop|link-down|  
quarantine|log-only}  
no application-proxy threat-protection

| Parameter  | Description   |
|------------|---|
| drop       | Apply a Layer 2 drop for traffic generating the threat reports. |
| link-down  | Set the link to error disabled in response to threats.          |
| quarantine | Move the offending port to a quarantine VLAN.                   |
| log-only   | Log when a threat is detected.                                  |

**Default** Threat protection is disabled by default.

**Mode** Interface Configuration

**Example** To set the threat protection blocking action on port1.0.4 to drop, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy threat-protection drop
```

To disable threat protection blocking actions on port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy threat-protection
```

**Related commands** [application-proxy quarantine-vlan](#)  
[application-proxy threat-protection send-summary](#)  
[clear application-proxy threat-protection](#)

[show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added  
Version 5.4.9-0.1: **log-only** parameter added

# application-proxy threat-protection send-summary

**Overview** Use this command to send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes. This command can only be performed on an AMF master.

**Syntax** `application-proxy threat-protection send-summary`

**Mode** Privileged Exec

**Example** To send a summary of all current threat-protection blocking requests to all AMF Application Proxy service nodes, use the command:

```
awplus# application-proxy threat-protection send-summary
```

**Related commands**

**Command changes** Version 5.4.7-2.2: command added

# application-proxy whitelist advertised-address

**Overview** Use this command to register a Layer 3 interface, and the IPv4 address that is attached to this interface, as the advertised application-proxy whitelist address for a device.

Use the **no** variant of this command to stop advertising the Layer 3 interface and its associated IPv4 address.

**Syntax** `application-proxy whitelist advertised-address <interface>`  
`no application-proxy whitelist advertised-address`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;interface&gt;</code> | Layer 3 interface to configure as the advertised address. |

**Default** No address advertised by default.

**Mode** Global Configuration

**Example** To configure the IPv4 address attached to VLAN 1 as the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist advertised-address
vlan1
```

To remove the advertised address, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist
advertised-address
```

**Related commands** [application-proxy whitelist server](#)  
[show application-proxy whitelist advertised-address](#)

**Command changes** Version 5.4.9-1.1: command added

# application-proxy whitelist enable

**Overview** Use this command to enable application-proxy whitelist based authentication on an interface.

Use the **no** variant of this command to disable the whitelist authentication.

**Syntax** application-proxy whitelist enable  
no application-proxy whitelist enable

**Default** Application-proxy whitelist is disabled by default.

**Mode** Interface Configuration

**Usage notes** When **port-control** is set to **auto**, the 802.1X authentication feature is executed on the interface, but only if the **aaa authentication dot1x** command has been issued.

If you attempt to change the authentication configuration on an interface that has threat protection quarantine configured, you will see the following error message:

```
% portx.x.x: Application Proxy quarantine configuration must be removed before port authentication is changed
```

Before changing the interface's authentication configuration you must either:

- remove the interface's threat protection configuration, or
- shut down the interface.

**Example** To enable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# application-proxy whitelist enable
```

To disable application-proxy whitelist authentication on the interface port1.0.4, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.4
awplus(config-if)# no application-proxy whitelist enable
```

**Related commands** application-proxy whitelist server  
show application-proxy whitelist interface  
show application-proxy whitelist server  
show application-proxy whitelist supplicant

**Command changes** Version 5.4.9-0.1: command added

# application-proxy whitelist protection tls

**Overview** Use this command to configure the application-proxy whitelist control channel to use TLS protection. If no trustpoint is specified then TLS will operate without authentication.

Use the **no** variant of this command to stop using TLS.

**Syntax** `application-proxy whitelist protection tls [trustpoint <name>]`  
`no application-proxy whitelist protection tls`

| Parameter                 | Description   |
|---------------------------|---|
| <code>trustpoint</code>   | Specify an optional trustpoint. If no trustpoint is specified then TLS will operate without authentication. |
| <code>&lt;name&gt;</code> | Name of the trustpoint.   |

**Default** TLS is disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF application-proxy whitelist to use TLS with the trustpoint 'corpca', use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist protection tls
trustpoint corpca
```

To configure an AMF application-proxy whitelist to stop using TLS, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist protection tls
```

**Related commands** [application-proxy whitelist enable](#)  
[application-proxy whitelist server](#)  
[show application-proxy whitelist server](#)

**Command changes** Version 5.5.0-2.1: command added

# application-proxy whitelist server

**Overview** Use this command to set an AMF master to act as a whitelist authentication proxy between AMF members, acting as Network Access Servers, and an external whitelist RADIUS server.

Use the **no** variant of this command to disable the whitelist proxy functionality.

**Syntax** `application-proxy whitelist server <ip-address> key <key>`  
`[auth-port <1-65535>]`  
`no application-proxy whitelist server`

| Parameter                              | Description  |
|--|--|
| <code>&lt;ip-address&gt;</code>        | IPv4 address of the upstream RADIUS server in dotted decimal format A.B.C.D.                           |
| <code>key &lt;key&gt;</code>           | Set the shared secret encryption key for communication with the upstream RADIUS server.                |
| <code>auth-port &lt;1-65535&gt;</code> | Set the RADIUS server UDP port. This is only necessary if you don't want to use the default port 1812. |

**Default** Disabled by default.

**Mode** Global Configuration

**Example** To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on port 1822, use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey auth-port 1822
```

To configure an AMF master to work as a proxy to the external RADIUS server 192.168.1.10, with shared secret 'mysecurekey', on the default port (1812), use the commands:

```
awplus# configure terminal
awplus(config)# application-proxy whitelist server 192.168.1.10
key mysecurekey
```

To disable the whitelist proxy, use the commands:

```
awplus# configure terminal
awplus(config)# no application-proxy whitelist server
```

show application-proxy whitelist supplicant

**Command changes** Version 5.4.9-0.1: command added

# application-proxy whitelist trustpoint (deprecated)

**Overview** This command has been deprecated. It has been replaced by the [application-proxy whitelist protection tls](#) command.

This command sets the trustpoint to use when communicating with the external whitelist RADIUS server. This enables RADIUS over TLS (RadSec) protection.

**Syntax** `application-proxy whitelist trustpoint <name>`  
`no application-proxy whitelist trustpoint`

**Command changes** Version 5.4.9-1.1: command added  
Version 5.5.0-2.1: command deprecated

# area-link

**Overview** Use this command to create an area-link between a Virtual AMF Appliance (VAA) host controller and an AMF container.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an area-link from a container.

**Syntax** `area-link <area-name>`  
`no area-link`

| Parameter                      | Description                            |
|--------------------------------|--|
| <code>&lt;area-name&gt;</code> | AMF area name of the container's area. |

**Mode** AMF Container Configuration

**Usage notes** The AMF area-link connects the AMF controller on a VAA host to the AMF container. Once a container has been created with the [atmf container](#) command and an area-link configured with the **area-link** command, it can be enabled using the [state](#) command.

You can only configure a single area-link on a container. You will see the following message if you try and configure a second one:

```
% AreaLink already configured for this container
```

Each container has two virtual interfaces:

- Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, configured using this area-link command.
- Interface eth1, used to connect to the outside world using a bridged L2 network link, configured using the [bridge-group \(amf-container\)](#) command.

See the [AMF Feature Overview and Configuration\\_Guide](#) for more information on these virtual interfaces and links.

**Example** To create the area-link to "wlg" on container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# area-link wlg
```

To remove an area-link from container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no area-link
```

**Related  
commands**

[atmf container](#)  
[show atmf container](#)

**Command  
changes**

Version 5.4.7-0.1: command added

# atmf-arealink

**Overview** This command to enable an Eth interface, on an AR-series device, as an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF area links that may exist for the selected Eth interface.

**Syntax** `atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no atmf-arealink`

| Parameter   | Description  |
|-------------|--|
| <area-name> | The name of the remote area that the interface is connecting to.   |
| <2-4094>    | The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link. |

**Default** By default, no area links are configured

**Mode** Eth interface on an AR-series device.

**Usage notes** Run this command on the interface at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will synchronize the area information stored on the two nodes.

You can configure multiple area links between two area nodes, but only one area link at any time will be in use. All other area links will block information, to prevent network storms.

**NOTE:** See the [switchport atmf-arealink](#) command to configure an AMF area link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF area link to the 'Auckland' area on VLAN 6, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# atmf-arealink remote-area Auckland vlan 6
```

To remove eth1 as an AMF area link, use the following commands:

```
master_1# configure terminal
master_1(config)# interface eth1
master_1(config-if)# no atmf-arealink
```

**Related commands**

- atmf area
- atmf area password
- atmf virtual-link
- show atmf links

**Command changes** Version 5.5.0-1.1: command added

# atmf-link

**Overview** Use this command to enable an Eth interface on an AR-series device as an up/down AMF link. This command is only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

Use the **no** variant of this command to remove any AMF link that may exist for the selected Eth interface.

**Syntax** atmf-link  
no atmf-link

**Mode** Eth interface on an AR-series device.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

If you run the command and AMF secure mode is not enabled, you will see the following error message:

```
Node_1(config)#int eth1
Node_1(config-if)#atmf-link
% Cannot configure eth1 because atmf secure-mode is not enabled.
```

**NOTE:** See the [switchport atmf-link](#) command to configure an AMF up/down link on an a switch port or link aggregator

**Example** To configure eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# atmf-link
```

To remove eth1 as an AMF up/down link, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface eth1
Node_1(config-if)# no atmf-link
```

**Related commands** [atmf recover over-eth](#)

[show atmf detail](#)  
[show atmf links](#)  
[switchport atmf-link](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf area

**Overview** This command creates an AMF area and gives it a name and ID number. Use the **no** variant of this command to remove the AMF area. This command is only valid on AMF controllers, master nodes and gateway nodes.

**Syntax** `atmf area <area-name> id <1-4094> [local]`  
`no atmf area <area-name>`

| Parameter   | Description   |
|-------------|---|
| <area-name> | The AMF area name. The area name can be up to 15 characters long. Valid characters are:<br>a..z<br>A..Z<br>0..9<br>-<br>_ Names are case sensitive and must be unique within an AMF network. The name cannot be the word "local" or an abbreviation of the word "local" (such as "l", "lo" etc.). |
| <1-4094>    | An ID number that uniquely identifies this area.  |
| local       | Set the area to be the local area. The local area contains the device you are configuring.  |

**Mode** Global Configuration

**Usage notes** This command enables you to divide your AMF network into areas. Each area is managed by at least one AMF master node. Each area can have up to 120 nodes, depending on the license installed on that area's master node.

The whole AMF network is managed by up to 8 AMF controllers. Each AMF controller can communicate with multiple areas. The number of areas supported on a controller depends on the license installed on that controller.

You must give each area in an AMF network a unique name and ID number.

Only one local area can be configured on a device. You must specify a local area on each controller, remote AMF master, and gateway node.

**Example** To create the AMF area named New-Zealand, with an ID of 1, and specify that it is the local area, use the command:

```
controller-1(config)# atmf area New-Zealand id 1 local
```

To configure a remote area named Auckland, with an ID of 100, use the command:

```
controller-1(config)# atmf area Auckland id 100
```

**Related commands**

- atmf area password
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

**Command changes** Version 5.5.1-2.1: area **id** maximum increased to 4094

# atmf area password

**Overview** This command sets a password on an AMF area.

Use the **no** variant of this command to remove the password.

This command is only valid on AMF controllers, master nodes and gateway nodes. The area name must have been configured first.

**Syntax** `atmf area <area-name> password [8] <password>`  
`no atmf area <area-name> password`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;area-name&gt;</code> | The AMF area name.  |
| 8                              | This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>8</b> on the CLI yourself. |
| <code>&lt;password&gt;</code>  | The password is between 8 and 32 characters long. It can include spaces.  |

**Mode** Global Configuration

**Usage notes** You must configure a password on each area that an AMF controller communicates with, except for the controller's local area. The areas must already have been created using the `atmf area` command.

Enter the password identically on both of:

- the area that locally contains the controller, and
- the remote AMF area masters

The command **show running-config atmf** will display the encrypted version of this password. The encryption keys will match between the controller and the remote AMF master.

If multiple controller and masters exist in an area, they must all have the same area configuration.

**Example** To give the AMF area named *Auckland* a password of "secure#1" use the following command on the controller:

```
controller-1(config)# atmf area Auckland password secure#1
```

and also use the following command on the master node for the Auckland area:

```
auck-master(config)# atmf area Auckland password secure#1
```

**Related  
commands**

- atmf area
- show atmf area
- show atmf area summary
- show atmf area nodes
- switchport atmf-arealink

# atmf authorize

**Overview** On an AMF network, with secure mode enabled, use this command on an AMF master to authorize an AMF node to join the network. AMF nodes waiting to be authorized appear in the pending authorization queue, which can be examined using the [show atmf authorization](#) command with the **pending** parameter.

Use the **no** variant of this command to revoke authorization for an AMF node on an AMF master.

**Syntax** `atmf authorize {<node-name> [area <area-name>]|all-pending}`  
`no atmf authorize <node-name> [area <area-name>]`

| Parameter   | Description  |
|-------------|--|
| <node-name> | The name of the node to be authorized or have its authorization revoked. |
| area        | Specify an AMF area.   |
| <area-name> | This is the name of the area the node belongs to.                        |
| all-pending | Authorize all nodes in the pending queue.                                |

**Mode** Privileged Exec

**Usage notes** On an AMF controller, AMF remote-area masters must be authorized by the controller, and the AMF remote-area masters will also need to authorized access from the AMF controller.

**Example** To authorize all AMF nodes in the pending authorization queue on an AMF master, use the command:

```
awplus# atmf authorize all-pending
```

To authorize a node called "node2" in remote AMF area "area3", use the command:

```
awplus# atmf authorize node2 area "area3"
```

To authorize a node called "node4" on an AMF master, use the command:

```
awplus# atmf authorize node4
```

To revoke authorization for a node called "node4" on an AMF master, use the command:

```
awplus# no atmf authorize node4
```

**Related commands**

- [atmf secure-mode](#)
- [clear atmf secure-mode certificates](#)
- [show atmf authorization](#)
- [show atmf secure-mode](#)

show atmf secure-mode certificates

show atmf secure-mode statistics

**Command changes** Version 5.4.7-0.3: command added

# atmf authorize provision

**Overview** Use this command from an AMF controller or AMF master to pre-authorize a node on an AMF network running in secure mode. This allows a node to join the AMF network the moment the `atmf secure-mode` command is run on that node.

Use the **no** variant of this command to remove a provisional authorization from and AMF controller or AMF master.

**Syntax**

```
atmf authorize provision [timeout <minutes>] node <node-name>
interface <interface-name> [area <area-name>]

atmf authorize provision [timeout <minutes>] mac <mac-address>

atmf authorize provision [timeout <minutes>] all

no atmf authorize provision node <node-name> interface
<interface-name> [area <area-name>]

no atmf authorize provision mac <mac-address>

no atmf authorize provision all
```

| Parameter        | Description  |
|------------------|--|
| timeout          | Timeout for provisional authorization. Authorization for provisioned nodes expires after the timeout period specified. |
| <minutes>        | Timeout in minutes. A value between 1 and 6000 is permissible with the default being 60 minutes.                       |
| node             | Specify a node to provision by node name.  |
| <node-name>      | The name of the node to provisionally authorize.   |
| interface        | Specify the interface the node will connect on.  |
| <interface-name> | The name of the interface, this can be a switchport, link aggregator, LACP link, or virtual link.                      |
| area             | Specify the AMF area.  |
| <area-name>      | This is the name of the area the node belongs to.  |
| mac              | Specify a node to provision by MAC address.  |
| <mac-address>    | Enter a MAC address to provisionally authorize in the format HHHH.HHHH.HHHH.   |
| all              | Provision authorization for all secure mode capable nodes.   |

**Default** The default timeout is 60 minutes.

**Mode** Privileged Exec

**Example** To provisionally authorize all non-secure AMF nodes, use the command:

```
awplus# atmf authorize provision all
```

To authorize a node with a MAC address of 0000.cd28.0880 for 2 hours, use the command:

```
awplus# authorize provision timeout 120 mac 0000.cd28.0880
```

To remove all provisional authorization, on an AMF master, use the command:

```
awplus# no atmf authorize provision all
```

**Related commands** [show atmf authorization](#)  
[show atmf secure-mode](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf backup

**Overview** This command can only be applied to a master node. It manually schedules an AMF backup to start at a specified time and to execute a specified number of times per day.

Use the **no** variant of this command to disable the schedule.

**Syntax** `atmf backup {default|<hh:mm> frequency <1-24>}`

| Parameter        | Description  |
|------------------|--|
| default          | Restore the default backup schedule.   |
| <hh:mm>          | Sets the time of day to apply the first backup, in hours and minutes. Note that this parameter uses the 24 hour clock. |
| backup           | Enables AMF backup to external media.  |
| frequency <1-24> | Sets the number of times within a 24 hour period that backups will be taken.   |

**Default** Backups run daily at 03:00 AM, by default

**Mode** Global Configuration

**Usage notes** Running this command only configures the schedule. To enable the schedule, you should then apply the command [atmf backup enable](#).

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To schedule backup requests to begin at 11 am and execute twice per day (11 am and 11 pm), use the following command:

```
node_1# configure terminal
node_1(config)# atmf backup 11:00 frequency 2
```

**CAUTION:** File names that comprise identical text, but with differing case, such as *Test.txt* and *test.txt*, will not be recognized as being different on FAT32 based backup media such as a USB storage device. However, these filenames will be recognized as being different on your Linux based device. Therefore, for good practice, ensure that you apply a consistent case structure for your back-up file names.

**Related commands** [atmf backup enable](#)  
[atmf backup stop](#)  
[show atmf backup](#)

# atmf backup area-masters delete

**Overview** Use this command to delete from external media, a backup of a specified node in a specified area.

Note that this command can only be run on an AMF controller.

**Syntax** `atmf backup area-masters delete area <area-name> node <node-name>`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;area-name&gt;</code> | The area that contains the node whose backup will be deleted. |
| <code>&lt;node-name&gt;</code> | The node whose backup will be deleted.                        |

**Mode** Privileged Exec

**Example** To delete the backup of the remote area-master named “well-gate” in the AMF area named Wellington, use the command:

```
controller-1# atmf backup area-masters delete area Wellington  
node well-gate
```

**Related commands** [show atmf backup area](#)

# atmf backup area-masters enable

**Overview** Use this command to enable backup of remote area-masters from the AMF controller. This command is only valid on AMF controllers.

Use the **no** form of the command to stop backups of remote area-masters.

**Syntax** `atmf backup area-masters enable`  
`no atmf backup area-masters enable`

**Mode** Global configuration

**Default** Remote area backups are disabled by default

**Usage notes** Use the following commands to configure the remote area-master backups:

- [atmf backup](#) to configure when the backups begin and how often they run
- [atmf backup server](#) to configure the backup server.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf backup area-masters enable
```

To disable scheduled backups of AMF remote area-masters, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf backup area-masters enable
```

**Related commands** [atmf backup server](#)  
[atmf backup](#)  
[show atmf backup area](#)

# atmf backup area-masters now

**Overview** Use this command to run an AMF backup of one or more remote area-masters from the AMF controller immediately.

This command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters now [area <area-name>|area <area-name>  
node <node-name>]`

| Parameter                      | Description                                    |
|--------------------------------|--|
| <code>&lt;area-name&gt;</code> | The area whose area-masters will be backed up. |
| <code>&lt;node-name&gt;</code> | The node that will be backed up.               |

**Mode** Privileged Exec

**Example** To back up all local master nodes in all areas controlled by controller-1, use the command

```
controller-1# atmf backup area-masters now
```

To back up all local masters in the AMF area named Wellington, use the command

```
controller-1# atmf backup area-masters now area Wellington
```

To back up the local master "well-master" in the Wellington area, use the command

```
controller-1# atmf backup area-masters now area Wellington node  
well-master
```

**Related commands** [atmf backup area-masters enable](#)  
[atmf backup area-masters synchronize](#)  
[show atmf backup area](#)

# atmf backup area-masters synchronize

**Overview** Use this command to synchronize backed-up area-master files between the active remote file server and the backup remote file server. Files are copied from the active server to the remote server.

Note that this command is only valid on AMF controllers.

**Syntax** `atmf backup area-masters synchronize`

**Mode** Privileged Exec

**Example** To synchronize backed-up files between the remote file servers for all area-masters, use the command:

```
controller-1# atmf backup area-masters synchronize
```

**Related commands**

- [atmf backup area-masters enable](#)
- [atmf backup area-masters now](#)
- [show atmf backup area](#)

# atmf backup bandwidth

**Overview** This command sets the maximum bandwidth in kilobytes per second (kBps) available to the AMF backup process. This command enables you to restrict the bandwidth that is utilized for downloading file contents during a backup.

**NOTE:** *This command will only run on an AMF master. An error message will be generated if the command is attempted on node that is not a master.*

*Also note that setting the bandwidth value to zero will allow the transmission of as much bandwidth as is available, which can exceed the maximum configurable speed of 1000 kBps. In effect, zero means unlimited.*

Use the **no** variant of this command to reset (to its default value of zero) the maximum bandwidth in kilobytes per second (kBps) available when initiating an AMF backup. A value of zero tells the backup process to transfer files using unlimited bandwidth.

**Syntax** `atmf backup bandwidth <0-1000>`  
`no atmf backup bandwidth`

| Parameter                   | Description                                       |
|-----------------------------|---|
| <code>&lt;0-1000&gt;</code> | Sets the bandwidth in kilobytes per second (kBps) |

**Default** The default value is zero, allowing unlimited bandwidth when executing an AMF backup.

**Mode** Global Configuration

**Examples** To set an atmf backup bandwidth of 750 kBps, use the commands:

```
node2# configure terminal
node2(config)# atmf backup bandwidth 750
```

To set the AMF backup bandwidth to the default value for unlimited bandwidth, use the commands:

```
node2# configure terminal
node2(config)# no atmf backup bandwidth
```

**Related commands** [show atmf backup](#)

# atmf backup delete

**Overview** This command removes the backup file from the external media of a specified AMF node.

Note that this command can only be run from an AMF master node.

**Syntax** `atmf backup delete <node-name>`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;node-name&gt;</code> | The AMF node name of the backup file to be deleted. |

**Mode** Privileged Exec

**Example** To delete the backup file from node2, use the following command:

```
Node_1# atmf backup delete node2
```

**Related commands**

- `show atmf backup`
- `atmf backup now`
- `atmf backup stop`

# atmf backup enable

**Overview** This command enables automatic AMF backups on the AMF master node that you are connected to. By default, automatic backup starts at 3:00 AM. However, this schedule can be changed by the [atmf backup](#) command. Note that backups are initiated and stored only on the master nodes.

Use the **no** variant of this command to disable any AMF backups that have been scheduled and previously enabled.

**Syntax** `atmf backup enable`  
`no atmf backup enable`

**Default** Automatic AMF backup functionality is enabled on the AMF master when it is configured and external media, i.e. an SD card or a USB storage device or remote server, is detected.

**Mode** Global Configuration

**Usage notes** A warning message will appear if you run the [atmf backup enable](#) command with either insufficient or marginal memory availability on your external storage device.

You can use the command [show atmf backup](#) on page 3254 to check the amount of space available on your external storage device.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To turn on automatic AMF backup, use the following command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup enable
```

**Related commands** [show atmf](#)  
[show atmf backup](#)  
[atmf backup](#)  
[atmf backup now](#)  
[atmf enable](#)

# atmf backup guests delete

**Overview** This command removes a guest node's backup files from external media such as a USB drive, SD card, or an external file server.

**Syntax** `atmf backup guests delete <node-name> <guest-port>`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest's parent node. |
| <code>&lt;guest-port&gt;</code> | The port number on the parent node.  |

**Mode** User Exec/Privileged Exec

**Example** On a parent node named "node1" (which, in this case, the user has a direct console connection to) use the following command to remove the backup files of the guest node that is directly connected to port1.0.3.

```
node1# atmf backup guests delete node1 port1.0.3
```

**Related Command**

- [atmf backup delete](#)
- [atmf backup area-masters delete](#)
- [show atmf backup guest](#)

# atmf backup guests enable

**Overview** Use this command to enable backups of remote guest nodes from an AMF master. Use the **no** variant of this command to disable the ability of the guest nodes to be backed up.

**Syntax** `atmf backup guests enable`  
`no atmf backup guests enable`

**Default** Guest node backups are enabled by default.

**Mode** Global Config

**Usage notes** We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** On the AMF master node, enable all scheduled guest node backups:

```
atmf-master# configure terminal
atmf-master(config)# atmf backup guests enable
```

**Related commands** [atmf backup area-masters enable](#)  
[show atmf backup guest](#)  
[atmf backup guests synchronize](#)

# atmf backup guests now

**Overview** This command manually triggers an AMF backup of guest nodes on a AMF Master.

**Syntax** `atmf backup guests now [<node-name>] [<guest-port>]`

| Parameter                       | Description                                      |
|---------------------------------|--|
| <code>&lt;node-name&gt;</code>  | The name of the guest's parent node.             |
| <code>&lt;guest-port&gt;</code> | The port number that connects to the guest node. |

**Default** n/a

**Mode** Privileged Exec

**Example** Use the following command to manually trigger the backup of all guests in the AMF network

```
awplus# atmf backup guests now
```

**Example** To manually trigger the backup of a guest node connected to port 1.0.23 of node1, use the following command:

```
awplus# atmf backup guests now node1 port1.0.23
```

**Related commands** [show atmf backup guest](#)

# atmf backup guests synchronize

**Overview** This command initiates a manual synchronization of all guest backup file-sets across remote file servers and various redundancy backup media, such as USB storage devices. This facility ensures that each device contains the same backup image files. Note that this backup synchronization process will occur as part of the regular backups scheduled by the [atmf backup](#) command.

**Syntax** `atmf backup guests synchronize`

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example** To synchronize backups across remote file servers and storage devices, use the command:

```
Node1#atmf backup guests synchronize
```

**Related commands** [atmf backup redundancy enable](#)  
[show atmf guests](#)  
[atmf backup guests enable](#)

# atmf backup now

**Overview** This command initiates an immediate AMF backup of either all AMF members, or a selected AMF member. Note that this backup information is stored in the external media on the master node of the device on which this command is run, even though the selected AMF member may not be a master node.

Note that this command can only be run on an AMF master node.

**Syntax** `atmf backup now [<nodename>]`

| Parameter                      | Description   |
|--------------------------------|---|
| <nodename><br>or<br><hostname> | The name of the AMF member to be backed up, as set by the command <code>hostname</code> on page 306. Where no name has been assigned to this device, then you must use the default name, which is the word "host", then an underscore, then (without a space) the MAC address of the device to be backed up. For example <code>host_0016_76b1_7a5e</code> . Note that the node-name appears as the command Prompt when in Privileged Exec mode. |

**Default** A backup is initiated for all nodes on the AMF (but stored on the master nodes).

**Mode** Privileged Exec

**Usage notes** Although this command will select the AMF node to be backed-up, it can only be run from any AMF master node.

**NOTE:** *The backup produced will be for the selected node but the backed-up config will reside on the external media of the AMF master node on which the command was run. However, this process will result in the information on one master being more up-to-date. To maintain concurrent backups on both masters, you can apply the backup now command to the master working-set. This is shown in Example 4 below.*

**Example 1** In this example, an AMF member has not been assigned a host name. The following command is run on the AMF\_Master\_2 node to immediately backup the device that is identified by its MAC address of 0016.76b1.7a5e:

```
AMF_Master_2# atmf backup now host_0016_76b1_7a5e
```

**NOTE:** *When a host name is derived from its MAC address, the syntax format entered changes from XXXX.XXXX.XXXX to XXXX\_XXXX\_XXXX.*

**Example 2** In this example, an AMF member has the host name, **office\_annex**. The following command will immediately backup this device:

```
AMF_Master_2# atmf backup now office_annex
```

This command is initiated on the device's master node named **AMF\_Master\_2** and initiates an immediate backup on the device named **office\_annex**.

**Example 3** To initiate from AMF\_master\_1 an immediate backup of all AMF member nodes, use the following command:

```
AMF_Master_1# amf backup now
```

**Example 4** To initiate an immediate backup of the node with the host-name “office\_annex” and store the configuration on both masters, use the following process:

From the AMF\_master\_1, set the working-set to comprise only of the automatic group, master nodes.

```
AMF_Master_1# atmf working-set group master
```

This command returns the following display:

```
=====
AMF_Master_1, AMF_Master_2
=====

Working set join
```

Backup the AMF member with the host name, **office\_annex** on both the master nodes as defined by the working set.

```
AMF_Master[2]# atmf backup now office_annex
```

Note that the [2] shown in the command prompt indicates a 2 node working-set.

**Related commands**

- [atmf backup](#)
- [atmf backup stop](#)
- [hostname](#)
- [show atmf backup](#)

# atmf backup redundancy enable

**Overview** This command is used to enable or disable AMF backup redundancy.

**Syntax** `atmf backup redundancy enable`  
`no atmf backup redundancy enable`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** If the AMF Master or Controller supports any removable media (SD card/USB), it uses the removable media as the redundant backup for the AMF data backup.

This feature is valid only if remote file servers are configured on the AMF Master or Controller.

We recommend using the ext3 or ext4 filesystem on external media that are used for AMF backups.

**Example** To enable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# atmf backup redundancy enable
```

To disable AMF backup redundancy, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf backup redundancy enable
```

**Related commands** [atmf backup synchronize](#)  
[show atmf backup](#)  
[show atmf backup area](#)

# atmf backup server

**Overview** This command configures remote file servers as the destination for AMF backups.

Use the **no** variant of this command to remove the destination server(s). When all servers are removed the system will revert to backup from external media.

**Syntax** `atmf backup server id {1|2} <hostlocation> username <username>  
[path <path>|port <1-65535>]`  
`no atmf backup server id {1|2}`

| Parameter      | Description  |
|----------------|--|
| id             | Remote server backup server identifier.  |
| {1 2}          | The backup server identifier number (1 or 2). Note that there can be up to two backup servers, numbered 1 and 2 respectively, and you would need to run this command separately for each server. |
| <hostlocation> | Either the name or the IP address (IPv4 or IPv6) of the selected backup server (1 or 2).   |
| username       | Configure the username to log in with on the selected remote file server.  |
| <username>     | The selected remote file server's username.  |
| path           | The location of the backup files on the selected remote file server. By default this will be the home directory of the username used to log in with.   |
| <path>         | The directory path utilized to store the backup files on the selected remote file server. No spaces are allowed in the path.   |
| port           | The connection to the selected remote backup file server using SSH. By default SSH connects to a device on TCP port 22 but this can be changed with this command.                                |
| <1-65535>      | A TCP port within the specified range.   |

**Defaults** Remote backup servers are not configured. The default SSH TCP port is 22. The path utilized on the remote file server is the home directory of the username.

**Mode** Global Exec

**Usage notes** The hostname and username parameters must both be configured.

**Examples** To configure server 1 with an IPv4 address and a username of *backup1*, use the commands:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 192.168.1.1
username backup1
```

To configure server 1 with an IPv6 address and a username of *backup1*, use the command:

```
AMF_backup1_1# configure terminal
AMF_Master_1(config)# atmf backup server id 1 FFEE::01 username
backup1
```

To configure server 2 with a hostname and username, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2
```

To configure server 2 with a hostname and username in addition to the optional path and port parameters, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# atmf backup server id 2 www.example.com
username backup2 path tokyo port 1024
```

To unconfigure the AMF remote backup file server 1, use the command:

```
AMF_Master_1# configure terminal
AMF_Master_1(config)# no atmf backup server id 1
```

**Related  
commands**    [show atmf backup](#)

# atmf backup stop

**Overview** Running this command stops a backup that is currently running on the master node you are logged onto. Note that if you have two masters and want to stop both, then you can either run this command separately on each master node, or add both masters to a working set, and issue this command to the working set.

Note that this command can only be run on a master node.

**Syntax** `atmf backup stop`

**Mode** Privileged Exec

**Usage notes** This command is used to halt an AMF backup that is in progress. In this situation the backup process will finish on its current node and then stop.

**Example** To stop a backup that is currently executing on master node node-1, use the following command:

```
AMF_Master_1# amf backup stop
```

**Related commands**

- [atmf backup](#)
- [atmf backup enable](#)
- [atmf backup now](#)
- [show atmf backup](#)

# atmf backup synchronize

**Overview** For the master node you are connected to, this command initiates a system backup of files from the node's active remote file server to its backup remote file server. Note that this process happens automatically each time the network is backed up.

Note that this command can only be run from a master node.

**Syntax** `atmf backup synchronize`

**Mode** Privileged Exec

**Example** When connected to the master node `AMF_Master_1`, the following command will initiate a backup of all system related files from its active remote file server to its backup remote file server.

```
AMF_Master_1# atmf backup synchronize
```

**Related commands**

- [atmf backup enable](#)
- [atmf backup redundancy enable](#)
- [show atmf](#)
- [show atmf backup](#)

# atmf cleanup

**Overview** This command is an alias to the [erase factory-default](#) command.

# atmf container

**Overview** Use this command to create or update an AMF container on a Virtual AMF Appliance (VAA) virtual machine.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove an AMF container.

**Syntax** `atmf container <container-name>`  
`no atmf container <container-name>`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;container-name&gt;</code> | The name of the AMF container to create, update, or remove. |

**Mode** AMF Container Configuration

**Usage notes** You cannot delete a container while it is still running. First use the **state disable** command to stop the container.

**Examples** To create or update the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)#
```

To remove the AMF container "vac-wlg-1", use the commands:

```
awplus# configure terminal
awplus(config)# no atmf container vac-wlg-1
```

**Related commands**

- [atmf container login](#)
- [bridge-group \(amf-container\)](#)
- [description \(amf-container\)](#)
- [show atmf container](#)
- [state](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf container login

**Overview** Use this command to login to an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `atmf container login <container-name>`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;container-name&gt;</code> | The name of the AMF container you wish to login into. |

**Mode** Privileged Exec

**Usage notes** If you try to login to a AMF container that has not been created, or is not running, you will see the following message:

```
% Container does not exist or is not running.
```

To exit from a container and return to the host VAA press `<Ctrl+a q>`.

**Example** To login to container “vac-wlg-1”, use the command:

```
awplus# atmf container login vac-wlg-1
```

You will then be presented with a login screen for that container:

```
Connected to tty 1
Type <Ctrl+a q> to exit the console, <Ctrl+a Ctrl+a> to enter Ctrl+a itself

vac-wlg-1 login: manager
Password: friend

AlliedWare Plus (TM) 5.4.7 02/03/17 08:46:12

vac-wlg-1>
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# atmf controller

**Overview** Use this command to configure the device as an AMF controller. This enables you to split a large AMF network into multiple areas.

AMF controller is a licensed feature. The number of areas supported on a controller depends on the license installed on that controller.

Use the **no** variant of this command to remove the AMF controller functionality.

**Syntax** `atmf controller`  
`no atmf controller`

**Mode** Global configuration

**Usage notes** If a valid AMF controller license is not available on the device, the device will accept this command but will not act as a controller until you install a valid license. The following message will warn you of this:

“An AMF Controller license must be installed before this feature will become active”

**NOTE:** *If the AMF controller functionality is removed from a device using the **no atmf controller** command then the device must be rebooted if it is to function properly as an AMF master.*

**Example** To configure the node named *controller-1* as an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# atmf controller
```

To stop the node named *controller-1* from being an AMF controller, use the commands:

```
controller-1# configure terminal
controller-1(config)# no atmf controller
```

**Related commands** [atmf area](#)  
[show atmf](#)

# atmf distribute firmware

**Overview** This command can be used to upgrade software one AMF node at a time. A URL can be selected from any media location. The latest compatible release for a node will be selected from this location.

Several procedures are performed to ensure the upgrade will succeed. This includes checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash on the new location.

The new release name is updated using the **boot system** command. The old release will become the backup release file. If a release file exists in a remote device (such as TFTP or HTTP, for example) then the URL should specify the exact release filename without using a wild card character.

The command will continue to upgrade software until all nodes are upgraded. At the end of the upgrade cycle the command should be used on the working-set.

**Syntax** `atmf distribute firmware <filename>`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;filename&gt;</code> | The filename and path of the file. See the <a href="#">File Management Feature Overview and Configuration Guide</a> for valid syntax. |

**Mode** Privileged Exec

**Examples** To upgrade nodes in a AMF network with a predefined AMF group called 'teams', use the following command:

```
Team1# atmf working-set group teams
```

```
=====
Team1, Team2, Team3:
=====
Working set join
```

```
ATMF_NETWORK[3]# atmf distribute firmware card:*.rel
```

```
Retrieving data from Team1
Retrieving data from Team2
Retrieving data from Team3

ATMF Firmware Upgrade:

Updating Release     : x930-5.4.7-1.1.rel information on Team3
=====
New firmware will not take effect until nodes are rebooted.
=====

ATMF_NETWORK[3]#
```

**Related commands** [atmf working-set](#)

# atmf domain vlan

**Overview** The AMF domain VLAN is created when the AMF network is first initiated and is assigned a default VID of 4091. This command enables you to change the VID from this default value on this device.

The AMF domain VLAN is one of AMF's internal VLANs (the management VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

An important point conceptually is that although the domain VLAN exists globally across the AMF network, it is assigned separately to each domain. The AMF network therefore can be thought of as comprising a series of domain VLANs each having the same VID and each being applied to a horizontal slice (domain) of the AMF. It follows therefore that the domain VLANs are only applied to ports that form cross-links and not to ports that form uplinks/downlinks.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to reset the VLAN ID to its default value of 4091.

**Syntax**

```
atmf domain vlan <2-4090>
no atmf domain vlan
```

| Parameter | Description                             |
|-----------|---|
| <2-4090>  | The VLAN number in the range 2 to 4090. |

**Default** VLAN 4091

**Mode** Global Configuration

**Usage notes** We recommend you only change the domain VLAN when first creating the AMF network, and only if VLAN 4091 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The domain VLAN will automatically be assigned an IP subnet address based on the value configured by the command *atmf management subnet*.

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF domain VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf domain vlan 4090
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF domain VLAN to its default of 4091 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf domain vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf management subnet](#)  
[atmf management vlan](#)

# atmf enable

**Overview** This command manually enables (turns on) the AMF feature for the device being configured.

Use the **no** variant of this command to disable (turn off) the AMF feature on the member node.

**Syntax** atmf enable  
no atmf enable

**Default** Once AMF is configured, the AMF feature starts automatically when the device starts up.

**Mode** Global Configuration

**Usage notes** The device does not auto negotiate AMF domain specific settings such as the Network Name. You should therefore, configure your device with any domain specific (non default) settings before enabling AMF.

**Examples** To turn off AMF, use the command:

```
MyNode# config terminal
MyNode(config)# no atmf enable
```

To turn on AMF, use the command:

```
MyNode(config)# atmf enable
```

This command returns the following display:

```
% Warning: The ATMF network config has been set to enable
% Save the config and restart the system for this change to take
effect.
```

# atmf group (membership)

**Overview** This command configures a device to be a member of one or more AMF groups. Groups exist in three forms: Implicit Groups, Automatic Groups, and User-defined Groups.

- Implicit Groups
  - all: All nodes in the AMF
  - current: The current working-set
  - local: The originating node.

Note that the Implicit Groups do not appear in show group output.

- Automatic Groups - These are defined by hardware architecture, e.g. x510, x230, x8100, AR3050S, AR4050S.
- User-defined Groups - These enable you to define arbitrary groups of AMF members based on your own criteria.

Each node in the AMF is automatically assigned membership to the implicit groups, and the automatic groups that are appropriate to its node type, e.g. x230, PoE. Similarly, nodes that are configured as masters are automatically assigned to the master group.

Use the **no** variant of this command to remove the membership.

**Syntax** `atmf group <group-list>`  
`no atmf group <group-list>`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;group-list&gt;</code> | A list of group names. These should be entered as a comma delimited list without spaces. Names can contain alphanumeric characters, hyphens and underscores. |

**Mode** Global Configuration

**Usage notes** You can use this command to define your own arbitrary groups of AMF members based on your own network's configuration requirements. Applying a node to a non existing group will result in the group automatically being created.

Note that the master nodes are automatically assigned to be members of the pre-existing master group.

The following example configures the device to be members of three groups; two are company departments, and one comprises all devices located in building\_2. To avoid having to run this command separately on each device that is to be added to these groups, you can remotely assign all of these devices to a working-set, then use the capabilities of the working-set to apply the [atmf group \(membership\)](#) command to all members of the working set.

**Example 1** To specify the device to become a member of AMF groups named *marketing*, *sales*, and *building\_2*, use the following commands:

```
node-1# configure terminal
node-1(config)# atmf group marketing,sales,building_2
```

**Example 2** To add the nodes *member\_node\_1* and *member\_node\_2* to groups *building1* and *sales*, first add the nodes to the working-set:

```
master_node# atmf working-set member_node_1,member_node_2
```

This command returns the following output confirming that the nodes *member\_node\_1* and *member\_node\_2* are now part of the working-set:

```
=====
member_node_1, member_node_2
=====

Working set join
```

Then add the members of the working set to the groups:

```
atmf-net[2]# configure terminal
atmf-net[2](config)# atmf group building1,sales
atmf-net[2](config)# exit
atmf-net[2]# show atmf group
```

This command returns the following output displaying the groups that are members of the working-set.

```
=====
member_node_1
=====

AMF group information

building1, sales
```

**Related commands** [show atmf group](#)  
[show atmf group members](#)

# atmf guest-class

**Overview** This modal command creates a guest-class. Guest-classes are modal templates that can be applied to selected guest types. Once you have created a guest-class, you can select it by entering its mode. From here, you can then configure a further set of operational settings specifically for the new guest-class.

These settings can then all be applied to a guest link by running the [switchport atmf-guestlink](#) command. The following settings can be configured from each guest class mode:

- discovery method
- model type
- http-enable setting
- guest port, user name, and password

The **no** variant of this command removes the guest-class. Note that you cannot remove a guest-class that is assigned to a port.

**Syntax** `atmf guest-class <guest-class-name>`  
`no atmf guest-class <guest-class-name>`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;guest-class-name&gt;</code> | The name assigned to the guest-class type. This can be chosen from an arbitrary string of up to 15 characters. |

**Mode** Global Configuration

**Example** To create a guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class camera
node1(config-atmf-guest)#
```

To remove the guest-class named 'camera' use the commands:

```
node1# configure terminal
node1(config)# no atmf guest-class camera
```

login-fallback enable

# atmf log-verbose

**Overview** This command limits the number of log messages displayed on the console or permanently logged.

Use the **no** variant of this command to reset to the default.

**Syntax** atmf log-verbose <1-3>  
no atmf log-verbose

| Parameter | Description   |
|-----------|---|
| <1-3>     | The verbose limitation (3 = noisiest, 1 = quietest) |

**Default** The default log display is 3.

**Usage** This command is intended for use in large networks where verbose output can make the console unusable for periods of time while nodes are joining and leaving.

**Mode** Global Configuration

**Example** To set the log-verbose to noise level 2, use the command:

```
node-1# configure terminal
node-1(config)# atmf log-verbose 2
```

**Validation Command** `show atmf`

# atmf management subnet

**Overview** This command is used to assign a subnet that will be allocated to the AMF management and domain management VLANs. From the address space defined by this command, two subnets are created, a management subnet component and a domain component, as explained in the Usage section below.

AMF uses these internal IPv4 subnets to communicate network status information between nodes. These subnet addresses must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to remove the assigned subnet.

**Syntax** `atmf management subnet <a.b.0.0>`  
`no atmf management subnet`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;a.b.0.0&gt;</code> | The IP address selected for the management subnet. Because a mask of 255.255.0.0 (i.e. /16) will be applied automatically, an IP address in the format a.b.0.0 must be selected. Usually this subnet address is selected from an appropriate range from within the private address space of 172.16.0.0 to 172.31.255.255, or 192.168.0.0, as defined in RFC1918. |

**Default** 172.31.0.0. A subnet mask of 255.255.0.0 will automatically be applied.

**Mode** Global Configuration

**Usage notes** Running this command will result in the creation of a further two subnets (within the class B address space assigned) and the mask will extend from /16 to /17.

For example, if the management subnet is assigned the address 172.31.0.0/16, this will result in the automatic creation of the following two subnets:

- 172.31.0.0/17 assigned to the [atmf management vlan](#)
- 172.31.128.0/17 assigned to the [atmf domain vlan](#).

We recommend you only change the management subnet when first creating the AMF network, and only if 172.31.0.0 is already being used in your network.

However, if you do need to change the subnet on an existing AMF network, use the following steps:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the domain VLAN, management VLAN, or management subnet. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new subnet address, using the commands:

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet <a.b.0.0>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new subnet.

- 4) Create the working set again, using the commands:

```
master(config)# exit
```

```
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the subnet on missing devices by logging into their consoles directly.

**Examples** To change the AMF management subnet address to 172.25.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
```

```
test[10]# configure terminal
```

```
test(config)[10]# atmf management subnet 172.25.0.0
```

```
master(config)# exit
```

```
master# atmf working-set group all
```

```
test[10]# write
```

To reset the AMF management subnet address to its default of 172.31.0.0 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management subnet
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands**

- [atmf domain vlan](#)
- [atmf management vlan](#)

# atmf management vlan

**Overview** The AMF management VLAN is created when the AMF network is first initiated and is assigned a default VID of 4092. This command enables you to change the VID from this default value on this device.

The AMF management VLAN is one of AMF's internal VLANs (the domain VLAN is the other internal VLAN). AMF uses these internal VLANs to communicate network status information between nodes. These VLANs must be reserved for AMF and not used for other purposes.

**CAUTION:** Every member of your AMF network must have the same domain VLAN, management VLAN, and management subnet.

**CAUTION:** If you change the domain VLAN, management VLAN, or management subnet of a node, that change takes effect immediately and the node will immediately leave the AMF network and try to rejoin it. The AMF network will not be complete until you have given all devices the same setting, so they can all rejoin the AMF network.

Use the **no** variant of this command to restore the VID to the default of 4092.

**Syntax** atmf management vlan <2-4090>  
no atmf management vlan

| Parameter | Description                                  |
|-----------|--|
| <2-4090>  | The VID assigned to the AMF management VLAN. |

**Default** VLAN 4092

**Mode** Global Configuration

**Usage notes** We recommend you only change the management VLAN when first creating the AMF network, and only if VLAN 4092 is already being used in your network.

However, if you do need to change the VLAN on an existing AMF network, use the following steps to ensure you change it on all nodes simultaneously:

- 1) Create a working set of the whole of your AMF network, using the commands:

```
master# atmf working-set group all
```

You must use **working-set group all** if changing the management VLAN. If you use a different working-set, nodes that are not in that working-set will lose contact with the AMF network.

- 2) The prompt will display the number of nodes in the AMF network. Record this number. In this example, the network is named "test" and has 10 nodes:

```
test[10]#
```

- 3) Enter the new VLAN ID, using the commands:

```
test[10]# configure terminal
test(config)[10]# atmf management vlan <2-4090>
```

The nodes will execute the command in parallel, leave the AMF network, and attempt to rejoin through the new VLAN.

- 4) Create the working set again, using the commands:

```
master(config)# exit
master# atmf working-set group all
```

- 5) Save the configuration, using the command:

```
test[10]# write
```

- 6) The prompt will display the number of nodes in the AMF network. Check that this is the same as the number in step 1. If it is not, you will need to change the VLAN on missing devices by logging into their consoles directly.

**NOTE:** The management VLAN will automatically be assigned an IP subnet address based on the value configured by the command [atmf management subnet](#).

The default VLAN ID lies outside the user-configurable range. If you need to reset the VLAN to the default VLAN ID, use the **no** variant of this command to do so.

**Examples** To change the AMF management VLAN to 4090 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# atmf management vlan 4090
master(config)# exit
master# atmf working-set group all
test[10]# write
```

To reset the AMF management VLAN to its default of 4092 in an existing AMF network, use the following commands:

```
master# atmf working-set group all
test[10]# configure terminal
test(config)[10]# no atmf management vlan
master(config)# exit
master# atmf working-set group all
test[10]# write
```

**Related commands** [atmf domain vlan](#)  
[atmf management subnet](#)

# atmf master

**Overview** This command configures the device to be an AMF master node and automatically creates an AMF master group. The master node is considered to be the core of the AMF network, and must be present for the AMF to form. The AMF master has its node depth set to 0. Note that the node depth vertical distance is determined by the number of uplinks/downlinks that exist between the node and its master.

An AMF master node must be present for an AMF network to form. Up to two AMF master nodes may exist in a network, and they **must** be connected by an AMF crosslink.

**NOTE:** Master nodes are an essential component of an AMF network. In order to run AMF, an AMF License is required for each master node.

If the crosslink between two AMF masters fails, then one of the masters will become isolated from the rest of the AMF network.

Use the **no** variant of this command to remove the device as an AMF master node. The node will retain its node depth of 0 until the network is rebooted.

**NOTE:** Node depth is the vertical distance (or level) from the master node (whose depth value is 0).

**Syntax** atmf master  
no atmf master

**Default** The device is not configured to be an AMF master node.

**Mode** Global Configuration

**Example** To specify that this node is an AMF master, use the following command:

```
node-1# configure terminal
node-1(config)# atmf master
```

**Related commands** [show atmf](#)  
[show atmf group](#)

# atmf mtu

**Overview** This command configures the AMF network Maximum Transmission Unit (MTU). The MTU value will be applied to the AMF Management VLAN, the AMF Domain VLAN and AMF Area links.

Use the **no** variant of this command to restore the default MTU.

**Syntax** `atmf mtu <1300-1442>`  
`no atmf mtu`

| Parameter   | Description   |
|-------------|---|
| <1300-1442> | The value of the maximum transmission unit for the AMF network, which sets the maximum size of all AMF packets generated from the device. |

**Default** 1300

**Mode** Global Configuration

**Usage notes** The default value of 1300 will work for all AMF networks (including those that involve virtual links over IPsec tunnels). If there are virtual links over IPsec tunnels anywhere in the AMF network, we recommend not changing this default. If there are no virtual links over IPsec tunnels, then this AMF MTU value may be increased for network efficiency.

**Example** To change the ATMF network MTU to 1442, use the command:

```
awplus(config)# atmf mtu 1442
```

**Related commands** [show atmf detail](#)

# atmf network-name

**Overview** This command applies an AMF network name to a (prospective) AMF node. In order for an AMF network to be valid, its network-name must be configured on at least two nodes, one of which must be configured as a master and have an AMF License applied. These nodes may be connected using either AMF downlinks or crosslinks.

For more information on configuring an AMF master node, see the command [atmf master](#).

Use the **no** variant of this command to remove the AMF network name.

**Syntax** `atmf network-name <name>`  
`no atmf network-name`

| Parameter                 | Description  |
|---------------------------|--|
| <code>&lt;name&gt;</code> | The AMF network name. Up to 15 printable characters can be entered for the network-name. |

**Mode** Global Configuration

**Usage notes** This is one of the essential commands when configuring AMF and must be entered on each node that is to be part of the AMF.

A switching node (master or member) may be a member of only one AMF network.

**CAUTION:** *Ensure that you enter the correct network name. Entering an incorrect name will cause the AMF network to fragment (at the next reboot).*

**Example** To set the AMF network name to `amf_net` use the command:

```
Node_1(config)# atmf network-name amf_net
```

# atmf provision (interface)

**Overview** This command configures a specified port on an AMF node to accept a provisioned node, via an AMF link, some time in the future.

Use the **no** variant of this command to remove the provisioning on the node.

**Syntax** `atmf provision <nodename>`  
`no atmf provision`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>&lt;nodename&gt;</code> | The name of the provisioned node that will appear on the AMF network in the future. |

**Mode** Interface Configuration for a switchport, a static aggregator, dynamic channel group or an Eth port on an AR-Series device.

**Usage notes** The port should be configured as an AMF link or cross link and should be 'down' to add or remove a provisioned node.

**Example** To provision an AMF node named node1 for port1.0.1, use the commands:

```
host1(config)# interface port1.0.1
host1(config-if)# atmf provision node1
```

**Related commands**

- `atmf provision node`
- `clone (amf-provision)`
- `configure boot config (amf-provision)`
- `configure boot system (amf-provision)`

- `show atmf links`
- `switchport atmf-link`
- `switchport atmf-crosslink`

# atmf provision node

**Overview** Use this command to provision a replacement node for a specified interface. Node provisioning is effectively the process of creating a backup file-set on a master node that can be loaded onto a provisioned node some time in the future. This file-set is created just as if the provisioned node really existed and was connected to the network. Typically these comprise configuration, operating system, and license files etc.

You can optionally provision a node with multiple device-type backups. When a device is then attached to the network, AMF uses its device-type to find the correct configuration to use. For example you can create an x510 and an x530 provisioning configuration for a node called 'node1' and if either an x510 or an x530 is attached to that node the appropriate configuration will be used.

Use the **no** variant of this command to remove a provisioned node.

**Syntax** `atmf provision node <nodename> [device <device-type>]`  
`no atmf provision node <nodename> [device <device-type>]`

| Parameter     | Description   |
|---------------|---|
| <nodename>    | The name of the provisioned node that will appear on the AMF network.   |
| device        | Optionally specify a device type.   |
| <device-type> | Any valid device type e.g. AR3050s, ie200, x950. For a full list of valid device types use the command <b>atmf provision node &lt;nodename&gt; device ?</b> . |

**Mode** Privileged Exec

**Usage notes** This command creates the directory structure for the provisioned node's file-set. It also switches to the AMF provision node prompt so that the nodes backup file-set can be created or updated. This is typically done with the [create \(amf-provision\)](#) or [clone \(amf-provision\)](#) commands.

For more information on AMF provisioning, see the [AMF Feature Overview and Configuration Guide](#)..

**Example** To configure node named 'node1', use the command:

```
awplus# atmf provision node node1  
awplus(atmf-provision) #
```

To configure a node named 'node1' for device type 'x530', use the command:

```
awplus# atmf provision node node1 device x530  
awplus(atmf-provision) #
```

**Related commands**

- atmf provision (interface)
- clone (amf-provision)
- configure boot config (amf-provision)
- configure boot system (amf-provision)
- copy (amf-provision)
- create (amf-provision)
- delete (amf-provision)
- identity (amf-provision)
- license-cert (amf-provision)
- locate (amf-provision)
- show atmf provision nodes

**Command changes** Version 5.4.9-0.1: command added

# atmf reboot-rolling

**Overview** This command enables you to reboot the nodes in an AMF working-set, one at a time, as a rolling sequence in order to minimize downtime. Once a rebooted node has finished running its configuration and its ports are up, it re-joins the AMF network and the next node is rebooted.

By adding the *url* parameter, you can also upgrade your devices' software one AMF node at a time.

The **force** parameter forces the rolling reboot to continue even if a previous node does not rejoin the AMF network. Without the **force** parameter, the unsuitable node will time-out and the rolling reboot process will stop. However, with the **force** parameter applied, the process will ignore the timeout and move on to reboot the next node in the sequence.

This command can take a significant amount of time to complete.

**Syntax** `atmf reboot-rolling [force] [<url>]`

| Parameter                | Description  |
|--------------------------|--|
| <code>force</code>       | Ignore a failed node and move on to the next node. Where a node fails to reboot a timeout is applied based on the time taken during the last reboot. |
| <code>&lt;url&gt;</code> | The path to the software upgrade file.   |

**Mode** Privileged Exec

**Usage notes** You can load the software from a variety of locations. The latest compatible release for a node will be selected from your selected location, based on the parameters and URL you have entered.

For example `card:/5.4.6/x*-5.4.6-*.rel` will select from the folder `card:/5.4.6` the latest file that matches the selection `x` (wildcard) `-5.4.6-` (wildcard).`rel`. Because `x*` is applied, each device type will be detected and its appropriate release file will be installed.

Other allowable entries are:

| Entry                                 | Used when loading software                              |
|---------------------------------------|---|
| <code>card:*.rel:</code>              | from an SD card   |
| <code>tftp:&lt;ip-address&gt;:</code> | from a TFTP server                                      |
| <code>usb:</code>                     | from a USB flash drive                                  |
| <code>flash:</code>                   | from flash memory, e.g. from one x930 switch to another |
| <code>scp:</code>                     | using secure copy                                       |
| <code>http:</code>                    | from an HTTP file server                                |

Several checks are performed to ensure the upgrade will succeed. These include checking the current node release boots from flash. If there is enough space on flash, the software release is copied to flash to a new location on each node as it is processed. The new release name will be updated using the **boot system**<release-name> command, and the old release will become the backup release file.

**NOTE:** *If you are using TFTP or HTTP, for example, to access a file on a remote device then the URL should specify the exact release filename without using wild card characters.*

On bootup the software release is verified. Should an upgrade fail, the upgrading unit will revert back to its previous software version. At the completion of this command, a report is run showing the release upgrade status of each node.

**NOTE:** *Take care when removing external media or rebooting your devices. Removing an external media while files are being written entails a significant risk of causing a file corruption.*

**Example 1** To reboot all x510 nodes in an AMF network, use the following command:

```
Bld2_Floor_1# atmf working-set group x510
```

This command returns the following type of screen output:

```
=====
node1, node2, node3:
=====

Working set join

AMF_NETWORK[3]#
```

```
ATMF_NETWORK[3]# atmf reboot-rolling
```

When the reboot has completed, a number of status screens appear. The selection of these screens will depend on the parameters set.

```
Bld2_Floor_1#atmf working-set group x510

=====
SW_Team1, SW_Team2, SW_Team3:
=====

Working set join

ATMF_NETWORK[3]#atmf reboot-rolling
ATMF Rolling Reboot Nodes:

Continue upgrading releases ? (y/n):

# atmf recover

**Overview** This command is used to manually initiate the recovery (or replication) of an AMF node, usually when a node is being replaced.

**Syntax** `atmf recover [<node-name> master <node-name>]`  
`atmf recover [<node-name> controller <node-name>]`

| Parameter                           | Description  |
|-------------------------------------|--|
| <i>&lt;node-name&gt;</i>            | The name of the device whose configuration is to be recovered or replicated.   |
| master<br><i>&lt;node-name&gt;</i>  | The name of the master device that holds the required configuration information.<br>Note that although you can omit both the node name and the master name; you cannot specify a master name unless you also specify the node name.      |
| controller <i>&lt;node-name&gt;</i> | The name of the controller that holds the required configuration information.<br>Note that although you can omit both the node name and the controller name; you cannot specify a controller name unless you also specify the node name. |

**Mode** Privileged Exec

**Usage notes** The recovery/replication process involves loading the configuration file for a node that is either about to be replaced or has experienced some problem. You can specify the configuration file of the device being replaced by using the *<node-name>* parameter, and you can specify the name of the master node or controller holding the configuration file.

If the *<node-name>* parameter is not entered then the node will attempt to use one that has been previously configured. If the replacement node has no previous configuration (and has no previously used node-name), then the recovery will fail.

If the master or controller name is not specified then the device will poll all known AMF masters and controllers and execute an election process (based on the last successful backup and its timestamp) to determine which to use. If no valid backup master or controller is found, then this command will fail.

No error checking occurs when this command is run. Regardless of the last backup status, the recovering node will attempt to load its configuration from the specified master node or controller.

If the node has previously been configured, we recommend that you suspend any AMF backup before running this command. This is to prevent corruption of the backup files on the AMF master as it attempts to both backup and recover the node at the same time.

**Example** To recover the AMF node named Node\_10 from the AMF master node named Master\_2, use the following command:

```
Master_2# atmf recover Node_10 master Master_2
```

**Related commands**

- atmf backup stop
- show atmf backup
- show atmf

# atmf recover guest

**Overview** Use this command to initiate a guest node recovery or replacement by reloading its backup file-set that is located within the AMF backup system. Note that this command must be run on the edge node device that connects to the guest node.

**Syntax** `atmf recover guest [<guest-port>]`

| Parameter                       | Description                                      |
|---------------------------------|--|
| <code>&lt;guest-port&gt;</code> | The port number that connects to the guest node. |

**Mode** User Exec/Privileged Exec

**Example** To recover a guest on node1 port1.0.1, use the following command

```
node1# atmf recover guest port1.0.1
```

**Related commands** [show atmf backup guest](#)

# atmf recover led-off

**Overview** This command turns off the recovery failure flashing port LEDs. It reverts the LED's function to their normal operational mode, and in doing so assists with resolving the recovery problem. You can repeat this process until the recovery failure has been resolved. For more information, see the [AMF Feature Overview and Configuration Guide](#).

**Syntax** `atmf recover led-off`

**Default** Normal operational mode

**Mode** Privileged Exec

**Example** To revert the LEDs on Node1 from recovery mode display to their normal operational mode, use the command:

```
Node1# atmf recover led-off
```

**Related commands** [atmf recover](#)

# atmf recover over-eth

**Overview** Use this command to enable AMF recovery over an AR-series device's Eth port. This setting persists even after restoring a device to a 'clean' state with the [erase factory-default](#) or [atmf cleanup](#) command.

Use the **no** variant of this command to disable AMF recover over an Eth port.

**Syntax** `atmf recover over-eth`  
`no atmf recover over-eth`

**Default** Eth ports cannot be used for recovery.

**Mode** Privileged Exec

**Usage notes** AMF links over Eth ports are only available if your network is running in AMF secure mode (see [atmf secure-mode](#) for more information on AMF secure mode).

**Example** To enable AMF recovery over an Eth port, use the command:

```
awplus# atmf recover over-eth
```

To disable AMF recovery over an Eth port, use the commands:

```
awplus# no atmf recover over-eth
```

**Related commands** [atmf-link](#)  
[atmf recover](#)  
[atmf secure-mode](#)  
[erase factory-default](#)  
[show atmf detail](#)

**Command changes** Version 5.5.0-1.1: command added

# atmf recovery-server

**Overview** Use this command on an AMF master to process recovery requests from isolated AMF nodes. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This option allows these nodes, which have no AMF neighbors, to be identified for recovery or provisioning purposes. They are identified using an identity token which is stored on the AMF master.

Use the **no** variant of this command to disable processing of recovery requests from isolated AMF nodes.

**Syntax** `atmf recovery-server`  
`no atmf recovery-server`

**Default** Recovery-server is disabled by default.

**Mode** Global Configuration

**Usage notes** Once **recovery-server** is enabled on an AMF network, the next time an isolated node is backed up its identity token will be stored in the AMF master's database. Should the device fail it can then be replaced and auto-recovery will occur as long as:

- the AMF master is accessible to the isolated node, and
- either, a DHCP server is configured to send the Uniform Resource Identifier (URI) of the AMF master to the recovering node, or
- a DNS server is configured to resolve the default recovery URI (`https://amfrecovery.alliedtelesis.com`) to the IP address of the AMF master.

Provisioning of isolated nodes is achieved by creating an identity token for the new node using the [identity \(amf-provision\)](#) command.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To enable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# atmf recovery-server
```

To disable recovery-server on an AMF master, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf recovery-server
```

**Related commands**

- [atmf backup](#)
- [atmf cleanup](#)
- [identity \(amf-provision\)](#)
- [atmf virtual-link](#)

**Command changes** Version 5.4.7-2.1: command added

# atmf remote-login

**Overview** Use this command to remotely login to other AMF nodes in order to run commands as if you were a local user of that node.

**Syntax** `atmf remote-login [user <name>] <nodename>`

| Parameter  | Description  |
|------------|--|
| <name>     | The name of a user on the remote node.                 |
| <nodename> | The name of the remote AMF node you are connecting to. |

**Mode** Privileged Exec (This command will only run at privilege level 15)

**Usage notes** You do not need a valid login on the local device in order to run this command. The session will take you to the enable prompt on the new device. If the remote login session exits for any reason (e.g. device reboot) you will be returned to the originating node.

You can create additional user accounts on nodes. AMF's goal is to provide a uniform management plane across the whole network, so we recommend you use the same user accounts on all the nodes in the network.

In reality, though, it is not essential to have the same accounts on all the nodes. Users can remote login from one node to a second node even if they are logged into the first node with a user account that does not exist on the second node (provided that `atmf restricted-login` is disabled and the user account on the first node has privilege level 15).

Moreover, it is possible to use a RADIUS or TACACS+ server to manage user authentication, so users can log into AMF nodes using user accounts that are present on the RADIUS or TACACS+ server, and not present in the local user databases of the AMF nodes.

The software will not allow you to run multiple remote login sessions. You must exit an existing session before starting a new one.

If you disconnect from the VTY session without first exiting from the AMF remote session, the device will keep the AMF remote session open until the `exec-timeout` time expires (10 minutes by default). If the `exec-timeout` time is set to infinity (`exec-timeout 0 0`), then the device is unable to ever close the remote session. To avoid this, we recommend you use the `exit` command to close AMF remote sessions, instead of closing the associated VTY sessions. We also recommend you avoid setting the `exec-timeout` to infinity.

**Example** To remotely login from node Node10 to Node20, use the following command:

```
Node10# atmf remote-login node20
Node20>
```

To close the session on Node20 and return to Node10's command line, use the following command:

```
Node20# exit
Node10#
```

In this example, user User1 is a valid user of node5. They can remotely login from node5 to node3 by using the following commands:

```
node5# atmf remote-login user User1 node3
node3> enable
```

**Related commands** [atmf restricted-login](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf restricted-login

**Overview** By default, users who are logged into any node on an AMF network are able to manage any other node by using either working-sets or an AMF remote login. If the access provided by this feature is too wide, or contravenes network security restrictions, it can be limited by running this command, which changes the access so that:

- users who are logged into non-master nodes cannot execute any commands that involve working-sets, and
- from non-master nodes, users can use remote-login, but only to login to a user account that is valid on the remote device (via a statically configured account or RADIUS/TACACS+). Users are also required to enter the password for that user account.

Once entered on any AMF master node, this command will propagate across the network.

Use the **no** variant of this command to disable restricted login on the AMF network. This allows access to the **atmf working-set** command from any node in the AMF network.

**Syntax** `atmf restricted-login`  
`no atmf restricted-login`

**Mode** Privileged Exec

**Default** Master nodes operate with **atmf restricted-login** disabled.  
Member nodes operate with **atmf restricted-login** enabled.

**NOTE:** *The default conditions of this command vary from those applied by its “no” variant. This is because the restricted-login action is only applied by **master** nodes, and in the absence of a master node, the default is to apply the restricted action to all **member** nodes with AMF configured.*

**Usage notes** In the presence of a **master** node, its default of **atmf restricted-login disabled** will propagate to all its member nodes. Similarly, any change in this command’s status that is made on a master node, will also propagate to all its member nodes

Note that once you have run this command, certain other commands that utilize the AMF working-set command, such as the **include**, **atmf reboot-rolling** and **show atmf group members** commands, will operate only on master nodes.

Restricted-login must be enabled on AMF areas with more than 120 nodes.

**Example** To enable restricted login, use the command

```
Node_20(config)# atmf restricted-login node20
```

**Related commands** [atmf remote-login](#)  
[show atmf](#)

**Command changes** Version 5.4.6-2.1: changes to AMF user account requirements

# atmf retry guest-link

**Overview** Use this command to retry an AMF guest-link by restarting AMF guest discovery on a port if it is currently in the failed state.

If no port is specified then all configured AMF guest-link ports that are in the failed state are retried.

If a port is specified then that port will only be retried if it is both:

- configured as an AMF guest-link, and
- it is currently in the failed state.

**Syntax** `atmf retry guest-link [<interface>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;interface&gt;</code> | Name of the interface the guest-link you want to retry is configured on. |

**Mode** Privileged Exec

**Example** To retry all configured AMF guest-link currently in a failed state, use the command:

```
awplus# atmf retry guest-link
```

To retry an AMF guest-link configured on port1.0.2 currently in a failed state, use the command:

```
awplus# atmf retry guest-link port1.0.2
```

**Related commands** [show atmf links guest](#)  
[switchport atmf-guestlink](#)

# atmf secure-mode

**Overview** Use this command to enable AMF secure mode on an AMF node. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before and AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once the secure mode command is run on all nodes on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

Use the **no** variant of this command to disable AMF secure mode on an AMF node.

**Syntax** `atmf secure-mode`  
`no atmf secure-mode`

**Default** Secure mode is disabled by default.

**Mode** Global Configuration

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

**Example** To enable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode
```

To disable AMF secure mode on an AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode
```

**Related commands** [atmf authorize](#)  
[atmf secure-mode certificate expiry](#)

clear atmf secure-mode certificates  
clear atmf secure-mode statistics  
show atmf  
show atmf authorization  
show atmf secure-mode  
show atmf secure-mode certificates  
show atmf secure-mode sa  
show atmf secure-mode statistics

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expire

**Overview** Use this command on an AMF master to expire a secure mode certificate. Running this command will force the removal of the AMF node from the network.

**Syntax** `atmf secure-mode certificate expire <node-name> [area <area-name>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;node-name&gt;</code> | Name of the AMF node you want to expire the certificate for.           |
| <code>area</code>              | Specify an AMF area.   |
| <code>&lt;area-name&gt;</code> | Name of the AMF area you want to expire the AMF nodes certificate for. |

**Mode** Privileged Exec

**Example** To remove an AMF node named "node3" from an AMF network, use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node3
```

To remove an AMF node named "node2" in an area named "area2", use the following command on the AMF master:

```
awplus# atmf secure-mode certificate expire node2 area area2
```

**Related commands**

- [atmf secure-mode](#)
- [show atmf secure-mode](#)
- [show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate expiry

**Overview** Use this command to set the expiry time of AMF secure mode certificates. Once an AMF node's certificate expires it must re-authorize and obtain a new certificate from the AMF master.

Use the **no** variant of this command to reset the expiry time to 180 days.

**Syntax** `atmf secure-mode certificate expiry {<days>|infinite}`  
`no atmf secure-mode certificate expiry`

| Parameter                 | Description  |
|---------------------------|--|
| <code>&lt;days&gt;</code> | Length of time, in days, that an AMF secure mode certificate remains valid. A value between 1 and 365. |
| <code>infinite</code>     | The authorization certificate does not expire, in other words AMF nodes stay authorized indefinitely.  |

**Default** The default expiry time is 180 days.

**Mode** Global Configuration

**Example** To set AMF secure mode certificate expiry to 7 days, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry 7
```

To set AMF secure mode certificates to never expire, use the commands:

```
awplus# configure terminal
awplus(config)# atmf secure-mode certificate expiry infinite
```

To reset the certificate expiry to 180 days, use the commands:

```
awplus# configure terminal
awplus(config)# no atmf secure-mode certificate expiry
```

**Related commands** [atmf secure-mode](#)  
[show atmf secure-mode](#)  
[show atmf secure-mode certificates](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode certificate renew

**Overview** Use this command to force all local certificates to expire and be renewed on an AMF secure mode network.

Secure mode certificates renew automatically but this command could be used to renew a certificate in a situation where the automatic renewal may happen while the device is not attached to the AMF network.

**Syntax** `atmf secure-mode certificate renew`

**Mode** Privileged Exec

**Example** To renew a local certificate on a AMF member or AMF master, use the command:

```
awplus# atmf secure-mode certificate renew
```

**Related commands** [show atmf secure-mode certificates](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf secure-mode enable-all

**Overview** Use this command to enable AMF secure mode on an entire network. AMF secure mode makes an AMF network more secure by:

- Adding an authorization mechanism before an AMF member is allowed to join an AMF network.
- The encryption of all AMF packets sent between AMF nodes.
- Adding support for user login authentication by RADIUS or TACACS+, and removing the requirement to have the same privileged user account in the local user database on all devices in the AMF network.
- Adding additional logging which enables network administrators to monitor attempts to gain unauthorized access to the AMF network.

Once this command is run on an AMF network, the AMF masters and AMF controllers manage the addition of AMF nodes and AMF areas to the AMF network.

This command can only be run on an AMF master.

Use the **no** variant of this command to disable AMF secure mode on an entire network.

**Syntax** `atmf secure-mode enable-all`  
`no atmf secure-mode enable-all`

**Default** Secure mode is disabled by default.

**Mode** Privileged Exec

**Usage notes** When an AMF network is running in AMF secure mode the [atmf restricted-login](#) feature is automatically enabled. This restricts the [atmf working-set](#) command to users that are logged on to an AMF master. This feature cannot be disabled independently of secure mode.

When AMF secure mode is enabled the AMF controllers and masters in the AMF network form a group of certificate authorities. A node may only join a secure AMF network once it has been authorized by a master or controller. When enabled, all devices in the AMF network must be running in secure mode. Unsecured devices will not be able to join a secure AMF network.

Running **atmf secure-mode enable-all**:

- Groups all AMF members in a working set.
- Executes [clear atmf secure-mode certificates](#) on the working set of members, which removes existing secure mode certificates from all the nodes.
- Groups all the AMF masters in a working set.
- Executes [atmf authorize provision all](#) on the working set of masters, so all masters provision all nodes.
- Groups all AMF nodes in a working set.

- Runs a script which executes `atmf secure-mode` and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

Running **no atmf secure-mode enable-all**:

- Groups all AMF nodes in a working set.
- Runs a script which executes **no atmf secure-mode** and then writes the configuration file on each node.
- Starts a timer that ticks every 10 seconds, for a maximum of 10 times, and checks if all the secure mode capable nodes rejoin the AMF network.

**NOTE:** Enabling or disabling secure mode on the network saves the running-config on every device.

**Example** To enable AMF secure mode on the entire network, use the command:

```
awplus# atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
Total number of nodes 21
21 nodes support secure-mode

Enable secure-mode across the AMF network ? (y/n): y
```

To disable AMF secure mode on the entire network, use the command:

```
awplus# no atmf secure-mode enable-all
```

You will be prompted to confirm the action:

```
% Warning: All security certificates will be deleted.
Disable secure-mode across the AMF network ? (y/n): y
```

**Related commands** [aaa authentication auth-web](#)  
[show atmf](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf select-area

**Overview** Use this command to access devices in an area outside the core area on the controller network. This command will connect you to the remote area-master of the specified area.

This command is only valid on AMF controllers.

The **no** variant of this command disconnects you from the remote area-master.

**Syntax** `atmf select-area {<area-name>|local}`  
`no atmf select-area`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;area-name&gt;</code> | Connect to the remote area-master of the area with this name. |
| <code>local</code>             | Return to managing the local controller area.                 |

**Mode** Privileged Exec

**Usage notes** After running this command, use the [atmf working-set](#) command to select the set of nodes you want to access in the remote area.

**Example** To access nodes in the area Canterbury, use the command

```
controller-1# atmf select-area Canterbury
```

This displays the following output:

```
Test_network[3]#atmf select-area Canterbury
=====
Connected to area Canterbury via host Avensis:
=====
```

To return to the local area for controller-1, use the command

```
controller-1# atmf select-area local
```

Alternatively, to return to the local area for controller-1, use the command

```
controller-1# no atmf select-area
```

**Related commands** [atmf working-set](#)

# atmf topology-gui enable

**Overview** Use this command to enable the operation of Vista Manager EX on the Master device.

Vista Manager EX delivers state-of-the-art monitoring and management for your Autonomous Management Framework™ (AMF) network, by automatically creating a complete topology map of switches, firewalls and wireless access points (APs). An expanded view includes third-party devices such as security cameras.

Use the **no** variant of this command to disable operation of Vista Manager EX.

**Syntax** atmf topology-gui enable  
no atmf topology-gui enable

**Default** Disabled by default on AMF Master and member nodes. Enabled by default on Controllers.

**Mode** Global Configuration mode

**Usage notes** To use Vista Manager EX, you must also enable the HTTP service on all AMF nodes, including all AMF masters and controllers. The HTTP service is enabled by default on AlliedWare Plus switches and disabled by default on AR-Series firewalls. To enable it, use the commands:

```
Node1# configure terminal
Node1(config)# service http
```

On one master in each AMF area in your network, you also need to configure the master to send event notifications to Vista Manager EX. To do this, use the commands:

```
Node1# configure terminal
Node1(config)# log event-host <ip-address> atmf-topology-event
```

**Examples** To enable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# atmf topology-gui enable
```

To disable Vista Manager EX on Node1, use the commands:

```
Node1# configure terminal
Node1(config)# no atmf topology-gui enable
```

**Related commands** [atmf enable](#)  
[log event-host](#)  
[service http](#)

# atmf trustpoint

**Overview** Use this command to set a PKI trustpoint for an AMF network. This command needs to be run on an AMF master or controller.

The self-signed certificate authority (CA) certificate is distributed to every node on the AMF network. It is used to verify client certificates signed by the trustpoint.

Use the **no** variant of this command to remove an AMF trustpoint.

**Syntax** `atmf trustpoint <trustpoint-name>`  
`no atmf trustpoint <trustpoint-name>`

| Parameter                            | Description             |
|--------------------------------------|-------------------------|
| <code>&lt;trustpoint-name&gt;</code> | Name of the trustpoint. |

**Default** No trustpoint is configured by default.

**Mode** Global Configuration

**Usage notes** Before using the **atmf trustpoint** command you will need to establish a trustpoint. For example, you can create a local self-signed trustpoint using the procedure outlined below.

Create a self-signed trustpoint called 'our\_trustpoint' with keypair 'our\_key':

```
awplus# configure terminal
awplus(config)# crypto pki trustpoint our_trustpoint
awplus(ca-trustpoint)# enrollment selfsigned
awplus(ca-trustpoint)# rsakeypair our_key
awplus(ca-trustpoint)# exit
awplus(config)# exit
```

Create the root and server certificates for this trustpoint:

```
awplus# crypto pki authenticate our_trustpoint
awplus# crypto pki enroll our_trustpoint
```

For more information about the AlliedWare Plus implementation of Public Key Infrastructure (PKI), see the [Public Key Infrastructure \(PKI\) Feature Overview and Configuration Guide](#)

**Example** To configure an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# atmf trustpoint our_trustpoint
```

To remove an AMF trustpoint for the trustpoint 'our\_trustpoint', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf trustpoint our_trustpoint
```

**Related commands** [crypto pki trustpoint](#)  
[show atmf](#)

**Command changes** Version 5.4.7-2.1: command added

# atmf virtual-crosslink

**Overview** Use this command to create a virtual crosslink. A virtual crosslink connects an AMF master or controller on a physical device to a Virtual AMF Appliance (VAA) master or controller.

All AMF master nodes must reside in the same AMF domain and are required to be directly connected using AMF crosslinks. In order to be able to meet this requirement for AMF masters running on VAAs, a virtual crosslink connects the AMF master or controller on the physical device to the master or controller on the VAA.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a virtual crosslink.

**Syntax**

```
atmf virtual-crosslink id <local-id> ip <local-ip> remote-id  
<remote-id> remote-ip <remote-ip>  
  
no atmf virtual-crosslink id <local-id>
```

| Parameter   | Description   |
|-------------|---|
| <local-id>  | ID of the local tunnel port, a value between 1 and 4094.  |
| <local-ip>  | IPv4 address of the local tunnel port in a.b.c.d format.  |
| <remote-id> | ID of the remote tunnel port, a value between 1 and 4094. |
| <remote-ip> | IPv4 address of the remote tunnel port in a.b.c.d format. |

**Default** No AMF virtual crosslinks are created by default.

**Mode** Global Configuration

**Usage notes** This command allows a virtual tunnel to be created between two remote sites over a Layer 3 link. The tunnel encapsulates AMF packets and allows them to be sent transparently across a Wide Area Network (WAN) such as the Internet.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID, and a remote IP address. Each side of the tunnel must be configured with the same, but mirrored parameters.

**NOTE:** *Virtual crosslinks are not supported on AMF container masters, therefore if multiple tenants on a single VAA host are configured for secure mode, only a single AMF master is supported per area.*

**Example** To setup a virtual link from a local site, "siteA", to a remote site, "siteB", (assuming there is already IP connectivity between the sites), run the following commands at the local site:

```
siteA# configure terminal
siteA(config)# atmf virtual-crosslink id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1
```

At the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# atmf virtual-crosslink id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1
```

To remove this virtual crosslink, run the following commands on the local site:

```
siteA# configure terminal
siteA(config)# no atmf virtual-crosslink id 5
```

On the remote site, run the commands:

```
siteB# configure terminal
siteB(config)# no atmf virtual-crosslink id 10
```

**Related commands**

- [atmf virtual-crosslink](#)
- [show atmf links](#)
- [switchport atmf-crosslink](#)

**Command changes** Version 5.4.7-0.3: command added

# atmf virtual-link

**Overview** This command creates one or more Layer 2 tunnels that enable AMF nodes to transparently communicate across a wide area network using Layer 2 connectivity protocols.

Once connected through the tunnel, the remote member will have the same AMF capabilities as a directly connected AMF member.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove the specified virtual link.

**Syntax**

```
atmf virtual-link id <1-4094> ip <a.b.c.d> remote-id <1-4094>  
remote-ip <a.b.c.d> [remote-area <area-name>]  
  
atmf virtual-link id <1-4094> interface <interface-name>  
remote-id <1-4094> remote-ip <a.b.c.d> [remote-area  
<area-name>]  
  
no atmf virtual-link id <1-4094>
```

| Parameter                     | Description   |
|-------------------------------|---|
| id <1-4094>                   | ID of the local tunnel point, in the range 1 to 4094.   |
| ip <a.b.c.d>                  | Specify the local IP address of the local interface for the virtual-link (alternatively you can specify the interface's name, see below).   |
| interface<br><interface-name> | Specify the local interface name for the virtual-link. This allows you to use a dynamic, rather than a static, local IP address.  |
| remote-id<1-4094>             | The ID of the (same) tunnel that will be applied by the remote node. Note that this must match the local-id that is defined on the remote node. This means that (for the same tunnel) the local and remote tunnel IDs are reversed on the local and remote nodes. |
| remote-ip<br><a.b.c.d>        | The IP address of the remote node.  |
| remote-area<br><area-name>    | The name of the remote area connected to this virtual-link.   |

**Mode** Global Configuration

**Usage notes** The Layer 2 tunnel that this command creates enables a local AMF session to appear to pass transparently across a Wide Area Network (WAN) such as the Internet. The addresses configured as the local and remote tunnel IP addresses must have IP connectivity to each other. If the tunnel is configured to connect a head office and branch office over the Internet, typically this would involve using

some type of managed WAN service such as a site-to-site VPN. Tunnels are only supported using IPv4.

Configuration involves creating a local tunnel ID, a local IP address, a remote tunnel ID and a remote IP address. A reciprocal configuration is also required on the corresponding remote device. The local tunnel ID must be unique to the device on which it is configured.

If an interface acquires its IP address dynamically then the local side of the tunnel can be specified by using the interface's name instead of using its IP address. When using a dynamic local address the remote address of the other side of the virtual-link must be configured with either:

- the IP address of the NAT device the dynamically configured interface is behind, or
- 0.0.0.0, if the virtual-link is configured as a secure virtual-link.

For instructions on how to configure dynamic IP addresses on virtual-links, see the [AMF Feature Overview and Configuration Guide](#).

The tunneled link may operate via external (non AlliedWare Plus) routers in order to provide wide area network connectivity. However in this configuration, the routers perform a conventional router to router connection. The protocol tunneling function is accomplished by the AMF nodes.

**NOTE:** AMF cannot achieve zero touch replacement of the remote device that terminates the tunnel connection, because you must pre-configure the local IP address and tunnel ID on that remote device.

**Example 1** Use the following commands to create the tunnel shown in the figure below.

Figure 60-1: AMF virtual link example

```
Node_10(config)# atmf virtual-link id 1 ip 192.168.1.1  
remote-id 2 remote-ip 192.168.2.1
```

```
Node_20(config)# atmf virtual-link id 2 ip 192.168.2.1  
remote-id 1 remote-ip 192.168.1.1
```

**Example 2** To set up an area virtual link to a remote site (assuming IP connectivity between the sites already), one site must run the following commands:

```
SiteA# configure terminal
SiteA(config)# atmf virtual-link id 5 ip 192.168.100.1
remote-id 10 remote-ip 192.168.200.1 remote-area SiteB-AREA
```

The second site must run the following commands:

```
SiteB# configure terminal
SiteB(config)# atmf virtual-link id 10 ip 192.168.200.1
remote-id 5 remote-ip 192.168.100.1 remote-area SiteA-AREA
```

Before you can apply the above **atmf virtual-link** command, you must configure the area names *SiteB-AREA* and *SiteA-AREA*.

**Command changes** Version 5.4.9-0.1: **interface** parameter added

# atmf virtual-link description

**Overview** Use this command to add a description to an existing AMF virtual-link.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove a description from an AMF virtual-link.

**Syntax** `atmf virtual-link id <1-4094> description <description>`  
`no atmf virtual-link id <1-4094> description`

| Parameter                        | Description                         |
|----------------------------------|-------------------------------------|
| <code>id &lt;1-4094&gt;</code>   | ID of the local tunnel point.       |
| <code>&lt;description&gt;</code> | A description for the virtual-link. |

**Default** No description is set by default.

**Mode** Global Configuration

**Example** To add a description to the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# atmf virtual-link id 5 description TO SITE B
```

To remove a description from the virtual-link with id '5', use the commands:

```
awplus# configure terminal
awplus(config)# no atmf virtual-link id 5
```

**Related commands** [atmf virtual-link](#)  
[show atmf links](#)  
[show atmf virtual-links](#)

# atmf virtual-link protection

**Overview** Use this command to add protection to an existing AMF virtual-link. Secure AMF virtual-links encapsulate the L2TPv3 frames of the virtual-link with IPsec.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove protection from an AMF virtual-link.

**Syntax**

```
atmf virtual-link id <1-4094> protection ipsec key [8]
<key-string>

no atmf virtual-link id <1-4094> protection
```

| Parameter    | Description   |
|--------------|---|
| id           | Specify the link ID.  |
| <1-4094>     | Link ID in the range 1 to 4094,   |
| protection   | Protection is on for this link.   |
| ipsec        | Security provided using IPsec.  |
| key          | Set the shared key.   |
| 8            | Specifies a string in an encrypted format instead of plain text. The running config will display the new password as an encrypted string even if password encryption is turned off. |
| <key-string> | Specify the shared key for the link.  |

**Default** Protection is off by default.

**Mode** Global Configuration

**Usage notes** The following limitations need to be considered when creating secure virtual-links.

- Switch devices support a maximum of 20 downstream AMF nodes when using a secure virtual-link as an uplink.
- When there are two or more AMF members behind a shared NAT device, only one of the members will be able to use secure virtual-links.
- An AMF Multi-tenant environment supports a maximum cumulative total of 1200 secure virtual-links across all AMF containers.

Secure virtual-links are only supported on the following device listed in the table below. There is also a limit to the number of links these devices support.

| Device  | Virtual-link Limit |
|---|--------------------|
| AMF Cloud/ VAA  | 300                |
| AR4050S<br>AR3050S<br>AR2050V<br>AR2010V              | 60                 |
| x220<br>x230/x230L<br>x310<br>x510/x510L<br>IX5-28GPX | 2                  |

**Example** To create and configure a virtual link with protection first create the virtual-link:

```
Host-A# configure terminal
```

```
Host-A(config)# atmf virtual-link id 1 ip 192.168.1.1 remote-id  
2 remote-ip 192.168.2.1
```

Enable protection on the virtual link:

```
Host-A(config)# atmf virtual-link id 1 protection ipsec key  
securepassword
```

Repeat these steps on the other side of the link:

```
Host-B(config)# atmf virtual-link id 2 ip 192.168.2.1 remote-id  
1 remote-ip 192.168.1.1
```

```
Host-B(config)# atmf virtual-link id 2 protection ipsec key  
securepassword
```

**Command  
changes** Version 5.4.9-0.1: command added

# atmf working-set

**Overview** Use this command to execute commands across an individually listed set of AMF nodes or across a named group of nodes.

Note that this command can only be run on a master node.

Use the **no** variant of this command to remove members or groups from the current working-set.

**Syntax**

```
atmf working-set {[<node-list>]|[group <group-list>|all|local|current]]}
no atmf working-set {[<node-list>]|[group <group-list>]}
```

| Parameter    | Description  |
|--------------|--|
| <node-list>  | A comma delimited list (without spaces) of nodes to be included in the working-set.  |
| group        | The AMF group.   |
| <group-list> | A comma delimited list (without spaces) of groups to be included in the working-set. Note that this can include either defined groups, or any of the Automatic, or Implicit Groups shown earlier in the bulleted list of groups. |
| all          | All nodes in the AMF.  |
| local        | Local node<br>Running this command with the parameters <b>group local</b> will return you to the local prompt and local node connectivity.   |
| current      | Nodes in current list.   |

**Mode** Privileged Exec

**Usage notes** You can put AMF nodes into groups by using the [atmf group \(membership\)](#) command.

This command opens a session on multiple network devices. When you change the working set to anything other than the local device, the prompt will change to the AMF network name, followed by the size of the working set, shown in square brackets. This command has to be run at privilege level 15.

In addition to the user defined groups, the following system assigned groups are automatically created:

- Implicit Groups
  - local: The originating node.
  - current: All nodes that comprise the current working-set.
  - all: All nodes in the AMF.

- Automatic Groups - These can be defined by hardware architecture, e.g. x510, x610, x8100, AR3050S or AR4050S, or by certain AMF nodal designations such as master.

Note that the Implicit Groups do not appear in `show atmf group` command output. If a node is an AMF master it will be automatically added to the master group.

**Example 1** To add all nodes in the AMF to the working-set, use the command:

```
node1# atmf working-set group all
```

**NOTE:** This command adds the implicit group "all" to the working set, where "all" comprises all nodes in the AMF.

This command displays an output screen similar to the one shown below:

```
=====
node1, node2, node3, node4, node5, node6:
=====

Working set join

ATMF_NETWORK_Name[6]#
```

**Example 2** To return to the local prompt, and connect to only the local node, use the command:

```
ATMF_Network_Name[6]# atmf working-set group local
node1#
```

The following table describes the meaning of the prompts in this example.

| Parameter         | Description  |
|-------------------|--|
| ATMF_Network_Name | The name of the AMF network, as set by the <code>atmf network-name</code> command. |
| [6]               | The number of nodes in the working-set.  |
| node1             | The name of the local node, as set by the <code>hostname</code> command.           |

# bridge-group (amf-container)

**Overview** Use this command to connect an AMF container to a bridge created on a Virtual AMF Appliance (VAA) virtual machine for AMF Cloud. This allows the AMF container to connect to a physical network.

Note that this command is only available on AMF Cloud, not on AlliedWare Plus switches.

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove a bridge-group from an AMF container.

**Syntax** `bridge-group <bridge-id>`  
`no bridge-group`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;bridge-id&gt;</code> | The ID of the bridge group to join, a number between 1 and 64. |

**Mode** AMF Container Configuration

**Usage notes** Each container has two virtual interfaces:

- 1) Interface eth0, used to connect to the AMF controller on the VAA host via an AMF area-link, and configured using this [area-link](#) command.
- 2) Interface eth1, used to connect to the outside world using a bridged L2 network link, and configured using the **bridge-group** command.

Before using this command, a bridge must be created with the same bridge-id on the VAA host using the **bridge <bridge-id>** command.

See the [AMF Feature Overview and Configuration Guide](#) for more information on configuring the bridge.

**Example** To assign a bridge group to AMF container 'vac-wlg-1', use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# bridge-group 1
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# clear application-proxy threat-protection

**Overview** Use this command to clear the threat protection for a specified address.

**Syntax** `clear application-proxy threat-protection {<ip-address>|<mac-address>|all}`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;ip-address&gt;</code>  | The IPv4 address you wish to clear the threat for, in A.B.C.D format.       |
| <code>&lt;mac-address&gt;</code> | The MAC address you wish to clear the threat for, in HHHH.HHHH.HHHH format. |
| <code>all</code>                 | Clear the threat for all IPv4 and MAC addresses.                            |

**Mode** Privileged Exec

**Example** To clear the threat for 10.34.199.117, use the command:

```
awplus# clear application-proxy threat-protection 10.34.199.117
```

**Related commands**

- [show application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# clear atmf links

**Overview** Use this command with no parameters to manually reset all the AMF links on a device. You can optionally specify an interface or range of interfaces to reset the links on.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct, view of the network.

**Syntax** `clear atmf links [<interface-list>]`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces or ports to perform the reset on. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.1)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a local port (e.g. of0)</li><li>• You can specify a continuous range of interfaces separated by a hyphen, or a comma-separated list (e.g. port1.0.1, port1.0.4-port1.0.18).</li></ul> <p>The specified interfaces must exist.<br/>If this parameter is left out then all links of the specified type will be reset on the device.</p> |

**Mode** Privileged Exec

**Example** To clear all AMF links on a device, use the following command:

```
awplus# clear atmf links
```

To clear all AMF links on port1.0.1 to port1.0.4 and static aggregator sa1, use the following command:

```
awplus# clear atmf links port1.0.1-port1.0.4,sa1
```

**Related commands** [clear atmf links virtual](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links virtual

**Overview** Use this command with no parameters to manually reset all the AMF virtual links on a device. You can, optionally, specify a comma separated list of virtual links to reset.

Certain events or topology changes can cause AMF links to be incorrect or outdated. Clearing the links forces AMF to relearn the information from neighboring nodes and create a fresh, correct view of the network.

**Syntax** `clear atmf links virtual [<virtuallink-list>]`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;virtuallink-list&gt;</code> | A single, or list, of AMF virtual link identifiers to reset. This must be a comma separated list of links e.g. <code>vlink1, vlink2, vlink3</code> . Specifying a link range e.g. <code>vlink1-vlink3</code> is not supported. |

**Mode** Privileged Exec

**Example** To clear all AMF virtual links on a device, use the following command:

```
awplus# clear atmf links virtual
```

To clear AMF virtual links `vlink11` and `vlink21`, use the following command:

```
awplus# clear atmf links virtual vlink11,vlink22
```

**Related commands** [clear atmf links](#)  
[show atmf links](#)

**Command changes** Version 5.4.8-2.1: command added

# clear atmf links statistics

**Overview** This command resets the values of all AMF link, port, and global statistics to zero.

**Syntax** `clear atmf links statistics`

**Mode** Privilege Exec

**Example** To reset the AMF link statistics values, use the command:

```
node_1# clear atmf links statistics
```

**Related commands** [show atmf links statistics](#)

# clear atmf recovery-file

**Overview** Use this command to delete all of a node's recovery files. It deletes the recovery files stored on:

- the local node,
- neighbor nodes, and
- external media (USB or SD card).

**Syntax** `clear atmf recovery-file`

**Mode** Privileged Exec

**Usage notes** AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

An AMF node with one of these special links pushes its startup configuration to its neighbors and to any attached external media. It then fetches and applies this configuration at recovery time. This configuration enables it to contact the AMF master and initiate a recovery.

Recovery files can become out of date if:

- a node's neighbor is off line when changes are made to its configuration, or
- when a node no longer contains a special link.

**Example** To clear a node's recovery files, use the command:

```
node1# clear atmf recovery-file
```

**Output** Figure 60-2: If AlliedWare Plus detects that a node contains a special link then the following message is displayed

```
node1#clear atmf recovery-file
% Warning: ATMF recovery files have been removed.
ATMF recovery may fail. Please save running-configuration.
```

**Related commands** [show atmf recovery-file](#)

**Command changes** Version 5.4.8-0.2: command added

# clear atmf secure-mode certificates

**Overview** Use this command to remove all certificates from an AMF member or master. AMF nodes will need to be re-authorized once this command has been run.

**Syntax** `clear atmf secure-mode certificates`

**Mode** Privileged Exec

**Example** To clear all certificates from an AMF node, use the command:

```
awplus# clear atmf secure-mode certificates
```

If this is the only master on the network you will see the following warning:

```
% Warning: This node is the only master in the network!  
All the nodes will become isolated and refuse to join any ATMF  
network. The certificates on all the isolated nodes must be  
cleared before rejoining an ATMF network will be possible.  
  
To clear certificates a reboot of the device is required.  
Clear certificates and Reboot ? (y/n):
```

On an AMF member you will see the following message:

```
To clear certificates a reboot of the device is required.  
Clear certificates and Reboot ? (y/n):
```

**Command changes** Version 5.4.7-0.3: command added

# clear atmf secure-mode statistics

**Overview** Use this command to reset all secure mode statistics to 0.

**Syntax** `clear atmf secure-mode statistics`

**Mode** Privileged Exec

**Example** To reset the AMF secure mode statistics information, use the command:

```
awplus# clear atmf secure-mode statistic
```

**Related commands** [show atmf secure-mode](#)  
[show atmf secure-mode statistics](#)

**Command changes** Version 5.4.7-0.3: command added

# clone (amf-provision)

**Overview** This command sets up a space on the backup media for use with a provisioned node and copies into it almost all files and directories from a chosen backup or provisioned node.

Alternatively, you can set up a new, unique provisioned node by using the command [create \(amf-provision\)](#).

**Syntax** `clone <source-nodename>`

| Parameter                            | Description  |
|--------------------------------------|--|
| <code>&lt;source-nodename&gt;</code> | The name of the node whose configuration is to be copied for loading to the clone. |

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

When using this command it is important to be aware of the following:

- A copy of `<media>:atmf/<atmf_name>/nodes/<source_node>/flash` will be made for the provisioned node and stored in the backup media.
- The directory `<node_backup_dir>/flash/.config/ssh` is excluded from the copy.
- All contents of `<root_backup_dir>/nodes/<nodename>` will be deleted or overwritten.
- Settings for the expected location of other provisioned nodes are excluded from the copy.

The active and backup configuration files are automatically modified in the following ways:

- The **hostname** command is modified to match the name of the provisioned node.
- The **stack virtual-chassis-id** command is removed, if present.

**Example** To copy from the backup of 'device2' to create backup files for the new provisioned node 'device3' use the following command:

```
device1# atmf provision node device3
device1(atmf-provision)# clone device2
```

Figure 60-3: Sample output from the **clone** command

```
device1# atmf provision node device3
device1(atmf-provision)#clone device2
Copying...
Successful operation
```

To confirm that a new provisioned node has been cloned, use the command:

```
device1# show atmf backup
```

The output from this command is shown in the following figure, and shows the details of the new provisioned node 'device3'.

Figure 60-4: Sample output from the **show atmf backup** command

```
device1#show atmf backup

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot config (amf-provision)

**Overview** This command sets the configuration file to use during the next boot cycle. This command can also set a backup configuration file to use if the main configuration file cannot be accessed for an AMF provisioned node. To unset the boot configuration or the backup boot configuration use the **no boot** command.

**Syntax** `configure boot config [backup] <file-path|URL>`  
`configure no boot config [backup]`

| Parameter       | Description   |
|-----------------|---|
| backup          | Specify that this is the backup configuration file. |
| <file-path URL> | The path or URL and name of the configuration file. |

**Default** No boot configuration files or backup configuration files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup configuration file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the configuration file 'branch.cfg' on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot config
branch.cfg
```

To set the configuration file 'backup.cfg' as the backup to the main configuration file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName(atmf-provision)# configure boot config backup
usb:/atmf/amf_net/nodes/node1/config/backup.cfg
```

To unset the boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config
```

To unset the backup boot configuration, use the command:

```
MasterNodeName(atmf-provision)# configure no boot config backup
```

**Related commands**

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# configure boot system (amf-provision)

**Overview** This command sets the release file that will load onto a specified provisioned node during the next boot cycle. This command can also set the backup release file to be loaded for an AMF provisioned node. To unset the boot system release file or the backup boot release file use the **no boot** command.

Use the **no** variant of this command to return to the default.

This command can only be run on AMF master nodes.

**Syntax** `configure boot system [backup] <file-path|URL>`  
`configure no boot system [backup]`

| Parameter                          | Description                                   |
|------------------------------------|---|
| <code>&lt;file-path URL&gt;</code> | The path or URL and name of the release file. |

**Default** No boot release file or backup release files are specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** When using this command to set a backup release file, the specified AMF provisioned node must exist. The specified file must exist in the flash directory created for the provisioned node in the AMF remote backup media.

**Examples** To set the release file x930-5.4.9-0.1.rel on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system
x930-5.4.9-0.1.rel
```

To set the backup release file x930-5.4.8-2.5.rel as the backup to the main release file on the AMF provisioned node 'node1', use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure boot system backup
card:/atmf/amf_net/nodes/node1/flash/x930-5.4.8-2.5.rel
```

To unset the boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system
```

To unset the backup boot release, use the command:

```
MasterNodeName# atmf provision node node1
MasterNodeName(atmf-provision)# configure no boot system backup
```

**Related commands** [atmf provision \(interface\)](#)

atmf provision node  
clone (amf-provision)  
configure boot config (amf-provision)  
create (amf-provision)  
delete (amf-provision)  
identity (amf-provision)  
license-cert (amf-provision)  
locate (amf-provision)  
show atmf provision nodes

**Command  
changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# copy (amf-provision)

**Overview** Use this command to copy configuration and release files for the node you are provisioning.

For more information about using the copy command see [copy \(filename\)](#) in the File and Configuration Management chapter.

**Syntax** `copy [force] <source-name> <destination-name>`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>force</code>                    | This parameter forces the copy command to overwrite the destination file, if it already exists, without prompting the user for confirmation.        |
| <code>&lt;source-name&gt;</code>      | The filename and path of the source file. See the <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax.   |
| <code>&lt;destination-name&gt;</code> | The filename and path for the destination file. See <a href="#">Introduction</a> of the File and Configuration Management chapter for valid syntax. |

**Mode** AMF Provisioning

**Example** To copy a configuration file named `current.cfg` from Node\_4's Flash into the `future_node` directory, and set that configuration file to load onto `future_node`, use the following commands:

```
node_4# atmf provision node future_node
node_4(atmf-provision)# create
node_4(atmf-provision)# locate
node_4(atmf-provision)# copy flash:current.cfg
./future_node.cfg
node_4(atmf-provision)# configure boot config future_node.cfg
```

**Related commands**

- [atmf provision \(interface\)](#)
- [atmf provision node](#)
- [clone \(amf-provision\)](#)
- [create \(amf-provision\)](#)
- [delete \(amf-provision\)](#)
- [locate \(amf-provision\)](#)
- [show atmf provision nodes](#)

**Command changes** Version 5.4.9-2.1: command added

# create (amf-provision)

**Overview** This command sets up an empty directory on the backup media for use with a provisioned node. This directory can have configuration and release files copied to it from existing devices. Alternatively, the configuration files can be created by the user.

An alternative way to create a new provisioned node is with the command [clone \(amf-provision\)](#).

This command can only run on AMF master nodes.

**Syntax** `create`

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network.

A date and time is assigned to the new provisioning directory reflecting when this command was executed. If there is a backup or provisioned node with the same name on another AMF master then the most recent one will be used.

**Example** To create a new provisioned node named "device2" use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# create
```

Running this command will create the following directories:

- `<media>:atmf/<atmf_name>/nodes/<node>`
- `<media>:atmf/<atmf_name>/nodes/<node>/flash`

To confirm the new node's settings, use the command:

```
device1# show atmf backup
```

The output for the **show atmf backup** command is shown in the following figure, and shows details for the new provisioned node 'device2'.

Figure 60-5: Sample output from the **show atmf backup** command

```
device1#show atmf backup

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# debug atmf

**Overview** This command enables the AMF debugging facilities, and displays information that is relevant (only) to the current node. The detail of the debugging displayed depends on the parameters specified.

If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

The **no** variant of this command disables either all AMF debugging information, or only the particular information as selected by the command's parameters.

**Syntax**

```
debug atmf  
[link|crosslink|arealink|database|neighbor|error|all]  
  
no debug atmf  
[link|crosslink|arealink|database|neighbor|error|all]
```

| Parameter | Description   |
|-----------|---|
| link      | Output displays debugging information relating to uplink or downlink information. |
| crosslink | Output displays all crosslink events.   |
| arealink  | Output displays all arealink events.  |
| database  | Output displays only notable database events.                                     |
| neighbor  | Output displays only notable AMF neighbor events.                                 |
| error     | Output displays AMF error events.   |
| all       | Output displays all AMF events.   |

**Default** All debugging facilities are disabled.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will display all AMF debugging information, including link events, topology discovery messages and all notable AMF events.

**NOTE:** An alias to the **no** variant of this command is [undebg atmf](#) on page 3335.

**Examples** To enable all AMF debugging, use the command:

```
node_1# debug atmf
```

To enable AMF uplink and downlink debugging, use the command:

```
node_1# debug atmf link
```

To enable AMF error debugging, use the command:

```
node_1# debug atmf error
```

**Related** no debug all  
**commands**

# debug atmf packet

**Overview** This command configures AMF Packet debugging parameters. The debug only displays information relevant to the current node. The command has following parameters:

**Syntax** debug atmf packet [direction {rx|tx|both}] [level {1|2|3}]  
[timeout <seconds>] [num-pkts <quantity>]  
[filter {node <name>|interface <ifname>}  
[pkt-type [1][2][3][4][5][6][7][8][9][10][11][12][13]]]

## Simplified Syntax

|                          |  |
|--------------------------|--|
| debug atmf packet        | [direction {rx tx both}]                                   |
|                          | [level {[1][2 3]}]   |
|                          | [timeout <seconds>]  |
|                          | [num-pkts <quantity>]                                      |
| debug atmf packet filter | [node <name>]  |
|                          | [interface <ifname>]                                       |
|                          | [pkt-type<br>[1][2][3][4][5][6][7][8][9][10][11][12][13]]] |

**NOTE:** You can combine the syntax components shown, but when doing so, you must retain their original order.

**Default** Level 1, both Tx and Rx, a timeout of 60 seconds with no filters applied.

**NOTE:** An alias to the **no** variant of this command - *undebug atmf* - can be found elsewhere in this chapter.

**Mode** User Exec and Global Configuration

**Usage notes** If no additional parameters are specified, then the command output will apply a default selection of parameters shown below:

| Parameter | Description  |
|-----------|--|
| direction | Sets debug to packet received, transmitted, or both  |
| rx        | packets received by this node  |
| tx        | Packets sent from this node  |
| 1         | AMF Packet Control header Information, Packet Sequence Number. Enter 1 to select this level. |
| 2         | AMF Detailed Packet Information. Enter 2 to select this level.                               |
| 3         | AMF Packet HEX dump. Enter 3 to select this level.   |
| timeout   | Sets the execution timeout for packet logging  |

| Parameter  | Description   |
|------------|---|
| <seconds>  | Seconds   |
| num-pkts   | Sets the number of packets to be dumped   |
| <quantity> | The actual number of packets  |
| filter     | Sets debug to filter packets  |
| node       | Sets the filter on packets for a particular Node  |
| <name>     | The name of the remote node   |
| interface  | Sets the filter to dump packets from an interface (portx.x.x) on the local node                   |
| <ifname>   | Interface port or virtual-link  |
| pkt-type   | Sets the filter on packets with a particular AMF packet type                                      |
| 1          | Crosslink Hello BPDU packet with crosslink links information. Enter 1 to select this packet type. |
| 2          | Crosslink Hello BPDU packet with downlink domain information. Enter 2 to select this packet type. |
| 3          | Crosslink Hello BPDU packet with uplink information. Enter 3 to select this packet type.          |
| 4          | Downlink and uplink hello BPDU packets. Enter 4 to select this packet type.                       |
| 5          | Non broadcast hello unicast packets. Enter 5 to select this packet type.                          |
| 6          | Stack hello unicast packets. Enter 6 to select this packet type.                                  |
| 7          | Database description. Enter 7 to select this packet type.   |
| 8          | DBE request. Enter 8 to select this packet type.  |
| 9          | DBE update. Enter 9 to select this packet type.   |
| 10         | DBE bitmap update. Enter 10 to select this packet type.   |
| 11         | DBE acknowledgment. Enter 11 to select this packet type.  |
| 12         | Area Hello Packets. Enter 12 to select this packet type.  |
| 13         | Gateway Hello Packets. Enter 13 to select this packet type.                                       |

**Examples** To set a packet debug on node 1 with level 1 and no timeout, use the command:

```
node_1# debug atmf packet direction tx timeout 0
```

To set a packet debug with level 3 and filter packets received from AMF node 1:

```
node_1# debug atmf packet direction tx level 3 filter node_1
```

To enable send and receive 500 packets only on vlink1 for packet types 1, 7, and 11, use the command:

```
node_1# debug atmf packet num-pkts 500 filter interface vlink1  
pkt-type 1 7 11
```

**Example** This example applies the **debug atmf packet** command and combines many of its options:

```
node_1# debug atmf packet direction rx level 1 num-pkts 60  
filter node x930 interface port1.1.1 pkt-type 4 7 10
```

# delete (amf-provision)

**Overview** This command deletes files that have been created for loading onto a provisioned node. It can only be run on master nodes.

**Syntax** delete

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. The command will only work if the provisioned node specified in the command has already been set up (although the device itself is still yet to be installed). Otherwise, an error message is shown when the command is run.

You may want to use the **delete** command to delete a provisioned node that was created in error or that is no longer needed.

This command cannot be used to delete backups created by the AMF backup procedure. In this case, use the command [atmf backup delete](#) to delete the files.

**NOTE:** *This command allows provisioned entries to be deleted even if they have been referenced by the [atmf provision \(interface\)](#) command, so take care to only delete unwanted entries.*

**Example** To delete backup files for a provisioned node named device3 use the command:

```
device1# atmf provision node device3  
device1(atmf-provision)# delete
```

To confirm that the backup files for provisioned node device3 have been deleted use the command:

```
device1# show atmf backup
```

The output should show that the provisioned node device3 no longer exists in the backup file, as shown in the figure below:

Figure 60-6: Sample output showing the **show atmf backup** command

```
device1#show atmf backup

- locate (amf-provision)
- show atmf provision nodes

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# discovery

**Overview** Use this command to specify how AMF learns about guest nodes.

AMF nodes gather information about guest nodes by using one of two internally defined discovery methods: static or dynamic.

With dynamic learning (the default method), AMF learns IP address and MAC addresses of guest nodes from LLDP or DHCP snooping. Dynamic learning is only supported when using IPv4. For IPv6, use static learning.

With dynamic learning, ensure that the command `ip dhcp snooping delete-by-linkdown` is set.

With static learning, you use the `switchport atmf-guestlink` command to specify the guest class name and IP address of the guest node attached to each individual switch port. AMF then learns the MAC addresses of each of the guests of that class from ARP or Neighbor discovery tables.

If you are using the static method, ensure that you have configured the appropriate class type for each of your statically discovered guest nodes.

The **no** variant of this command returns the discovery method to **dynamic**.

**Syntax** `discovery [static|dynamic]`  
`no discovery`

| Parameter            | Description                          |
|----------------------|--------------------------------------|
| <code>static</code>  | Statically assigned.                 |
| <code>dynamic</code> | Learned from DCHCP Snooping or LLDP. |

**Default** Dynamic

**Mode** AMF Guest Configuration

**Usage notes** This command is one of several modal commands that are configured and applied for a specific guest-class (mode). Its settings are automatically applied to a guest-node link by the `switchport atmf-guestlink` command.

**NOTE:** AMF guest nodes are not supported on ports using the OpenFlow protocol.

**Example 1** To configure the discovery of the guest-class camera to operate statically, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class camera
Node1(config-atmf-guest)# discovery static
```

**Example 2** To return the discovery method for the guest class TQ4600-1 to its default of **dynamic**, use the following commands:

```
Node1# configure terminal
Node1(config)# atmf guest-class TQ4600-1
Node1(config-atmf-guest)# no discovery
```

**Related commands**

- atmf guest-class
- switchport atmf-guestlink
- show atmf links guest
- show atmf nodes

# description (amf-container)

**Overview** Use this command to set the description on an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

Use the **no** variant of this command to remove the description from an AMF container.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;description&gt;</code> | Enter up to 128 characters of text describing the AMF container. |

**Mode** AMF Container Configuration

**Example** To set the description for AMF container “vac-wlg-1” to “Wellington area”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# description Wellington area
```

To remove the description for AMF container “vac-wlg-1”, use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# no description
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# erase factory-default

**Overview** This command erases all data from NVS and all data from flash **except** the following:

- the boot release file (a .rel file) and its release setting file
- all license files
- the latest GUI release file

The device is then rebooted and returned to its factory default condition. The device can then be used for AMF automatic node recovery.

**Syntax** `erase factory-default`

**Mode** Privileged Exec

**Usage notes** This command is an alias to the [atmf cleanup](#) command.

Note that this command can only be used on standalone switches, not stacked switches.

**Example** To erase data, use the command:

```
Node_1# erase factory-default
```

```
This command will erase all NVS, all flash contents except for  
the boot release, a GUI resource file, and any license files,  
and then reboot the switch. Continue? (y/n):y
```

**Related commands** [atmf cleanup](#)

# http-enable

**Overview** This command is used to enable GUI access to a guest node. When **http-enable** is configured, the port number is set to its default of 80. If the guest node is using a different port for HTTP, you can configure this using the **port** parameter.

This command is used to inform the GUI that this device has an HTTP interface at the specified port number so that a suitable URL can be provided to the user.

Use the **no** variant of this command to disable HTTP.

**Syntax** `http-enable [port <port-number>]`  
`no http-enable`

| Parameter     | Description                       |
|---------------|-----------------------------------|
| port          | TCP port number.                  |
| <port-number> | The port number to be configured. |

**Default** Not set

**Mode** AMF Guest Configuration

**Usage notes** If **http-enable** is selected without a **port** parameter the port number will default to 80.

**Example** To enable HTTP access to a guest node on port 80 (the default), use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable
```

To enable HTTP access to a guest node on port 400, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# http-enable port 400
```

To disable HTTP access to a guest node, use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class Camera
node1(config-atmf-guest)# no http-enable
```

**Related commands** [atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf links guest](#)

`show atmf nodes`

# identity (amf-provision)

**Overview** Use this command to create an identity token for provisioning an isolated AMF node. An isolated node is an AMF member that is only connected to the rest of the AMF network via a virtual-link.

This command allows these nodes, which have no AMF neighbors, to be identified for provisioning purposes. They are identified using an identity token which is based on either the next-hop MAC address of the provisioned node, or the serial number of the device being provisioned. This identity token is stored on the AMF master.

Use the **no** variant of this command to remove the identity token for a node.

**Syntax**

```
identity mac-address <mac-address> prefix  
<ip-address/prefix-length>  
  
identity serial-number <serial-number> prefix  
<ip-address/prefix-length>  
  
no identity
```

| Parameter                      | Description   |
|--------------------------------|---|
| mac-address                    | Specify the next-hop MAC address of the device being provisioned.                           |
| <mac-address>                  | MAC address of the port the provisioned node is connected to, in the format xxxx.xxxx.xxxx. |
| serial-number                  | Specify the serial number of the device to be provisioned.                                  |
| <serial-number>                | Serial number of the device that is being provisioned.                                      |
| prefix                         | IPv4 address, and prefix length, of the virtual-link interface on the isolated node         |
| <ip-address/<br>prefix-length> | IPv4 address, and prefix length, in A.B.C.D/M format.                                       |

**Mode** AMF Provisioning

**Usage notes** To provision an isolated node, first create a configuration for the node using the [create \(amf-provision\)](#) and/or the [clone \(amf-provision\)](#) commands.

Then create an identity token for the provisioned node by either specifying its next-hop MAC address or by specifying the serial number of the replacement device. The advantage of using the next-hop MAC address is that any device, regardless of its serial number, can be added to the network but using the serial number maybe preferred in situations where the next-hop MAC address is not easy to obtain.

The [atmf recovery-server](#) option must be enabled on the AMF master before attempting to provision the device. This option allows the AMF master to process recovery requests from isolated AMF nodes.

See the [AMF Feature Overview and Configuration Guide](#) for information on preparing your network for recovering or provisioning isolated nodes.

**Example** To create a identity token on your AMF master for a device named “my-x930” with serial number “A10064A172100008”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity serial-number
A10064A172100008 prefix 192.168.2.25/24
```

To create a identity token on your AMF master for a device named “my-x930” with next-hop MAC address “0000.cd28.0880”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# identity mac-address 0000.cd28.0880
prefix 192.168.2.25/24
```

To delete the identity token from your AMF master for a device named “my-x930”, use the command:

```
awplus# atmf provision node my-x930
awplus(atmf-provision)# no identity
```

**Command changes**

Version 5.4.9-0.1: syntax change due to new AMF provisioning mode  
Version 5.4.7-2.1: command added

# license-cert (amf-provision)

**Overview** This command is used to set up the license certificate for a provisioned node.

The certificate file usually has all the license details for the network, and can be stored anywhere in the network. This command makes a hidden copy of the certificate file and stores it in the space set up for the provisioned node on AMF backup media.

For node provisioning, the new device has not yet been part of the AMF network, so the user is unlikely to know its product ID or its MAC address. When such a device joins the network, assuming that this command has been applied successfully, the copy of the certificate file will be applied automatically to the provisioned node.

Once the new device has been resurrected on the network and the certificate file has been downloaded to the provisioned node, the hidden copy of the certificate file is deleted from AMF backup media.

Use the **no** variant of this command to set it back to the default.

This command can only be run on AMF master nodes.

**Syntax** `license-cert <file-path|URL>`  
`no license-cert`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;file-path URL&gt;</code> | The name of the certificate file. This can include the file-path of the file. |

**Default** No license certificate file is specified for the provisioned node.

**Mode** AMF Provisioning

**Usage notes** This command is only available on master nodes in the AMF network. It will only operate if the provisioned node specified in the command has already been set up, and if the license certification is present in the backup file. Otherwise, an error message is shown when the command is run.

**Example 1** To apply the license certificate 'cert1.txt' stored on a TFTP server for AMF provisioned node "device2", use the command:

```
device1# atmf provision node device2
device1(atmf-provision)# license-cert
tftp://192.168.1.1/cert1.txt
```

**Example 2** To apply the license certificate 'cert2.txt' stored in the AMF master's flash directory for AMF provisioned node 'host2', use the command:

```
device1# atmf provision node host2
device1(atmf-provision)# license-cert /cert2.txt
```

To confirm that the license certificate has been applied to the provisioned node, use the command `show atmf provision nodes`. The output from this command is shown below, and displays license certification details in the last line.

Figure 60-7: Sample output from the `show atmf provision nodes` command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .....: SD (Total 3827.0MB, Free 3481.1MB)

Node Name           : device2
Date & Time         : 06-Oct-2016 & 23:25:44
Provision Path      : card:/atmf/nodes

Boot configuration :
Current boot image  : x510-5.4.6-1.4.rel (file exists)
Backup boot image   : x510-5.4.6-1.3.rel (file exists)
Default boot config : flash:/default.cfg (file exists)
Current boot config : flash:/abc.cfg (file exists)
Backup boot config  : flash:/xyz.cfg (file exists)

Software Licenses :
Repository file     : ../configs/.sw_v2.lic

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# locate (amf-provision)

**Overview** This command changes the present working directory to the directory of a provisioned node. This makes it easier to edit files and create a unique provisioned node in the backup.

This command can only be run on AMF master nodes.

**NOTE:** We advise that after running this command, you return to a known working directory, typically *flash*.

**Syntax** `locate`

**Mode** AMF Provisioning

**Example** To change the working directory that happens to be on device1 to the directory of provisioned node device2, use the following command:

```
device1# atmf provision node device2
device1[atmf-provision]# locate
```

The directory of the node device2 should now be the working directory. You can use the command `pwd` to check this, as shown in the following figure.

Figure 60-8: Sample output from the `pwd` command

```
device2#pwd
card:/atmf/building_2/nodes/device2/flash
```

The output above shows that the working directory is now the flash of device2.

**Command changes** Version 5.4.9-0.1: syntax change due to new AMF provisioning mode

# log event-host

**Overview** Use this command to set up an external host to log AMF topology events through Vista Manager. This command is run on the Master device.

Use the **no** variant of this command to disable log events through Vista Manager.

**Syntax** `log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`  
`no log event-host [<ipv4-addr>|<ipv6-addr>] atmf-topology-event`

| Parameter                      | Description                    |
|--------------------------------|--------------------------------|
| <code>&lt;ipv4-addr&gt;</code> | ipv4 address of the event host |
| <code>&lt;ipv6-addr&gt;</code> | ipv6 address of the event host |

**Default** Log events are disabled by default.

**Mode** Global Configuration

**Usage notes** Event hosts are set so syslog sends the messages out as they come.

Note that there is a difference between log event and log host messages:

- Log event messages are sent out as they come by syslog
- Log host messages are set to wait for a number of messages (20) to send them out together for traffic optimization.

**Example** To enable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# log event-host 192.0.2.31 atmf-topology-event
```

To disable Node 1 to log event messages from host IP address 192.0.2.31, use the following commands:

```
Node1# configure terminal
```

```
Node1(config)# no log event-host 192.0.2.31 atmf-topology-event
```

**Related commands** [atmf topology-gui enable](#)

# login-fallback enable

**Overview** Use this command to enable login fallback on TQ model AMF guest nodes. This allows AMF to try the factory default username and password if the guest node's saved username and password fail.

Use the **no** variant of this command to disable login fallback.

**Syntax** login-fallback enable  
no login-fallback enable

**Default** Disabled

**Mode** AMF Guest Configuration

**Usage notes** This feature is only supported on TQ model guest nodes.

Login fallback means: if a guest node's saved username and password fail, AMF will try to connect to the node using the factory default username and password (manager/friend). When a new TQ replaces an existing TQ, this allows the new TQ to be discovered and managed as an AMF guest node. AMF can then start the AMF guest node recovery procedure.

**Example** To use the login fallback feature, first create an AMF guest class for TQ model APs. Then enable the login fall back feature.

For example, to enable login fallback on the guest-class AT-TQ5k, use the commands:

```
node1#configuration terminal
node1(config)#atmf guest-class AT-TQ5k
node1(config-atmf-guest)#login-fallback enable
node1(config-atmf-guest)#end
node1#
```

**Related commands** [atmf guest-class](#)  
[modeltype](#)  
[switchport atmf-guestlink](#)

**Command changes** Version 5.5.0-1.1: command added

# modeltype

**Overview** This command sets the expected model type of the guest node. The model type will default to **other** if nothing is set.

Use the **no** variant of this command to reset the model type to **other**.

**Syntax** `modeltype {alliedware|aw+|onvif|tq|other}`  
`no modeltype`

| Parameter  | Description  |
|------------|--|
| alliedware | A legacy Allied Telesis operating system.                    |
| aw+        | The Allied Telesis AlliedWare Plus operating system.         |
| onvif      | ONVIF (Open Network Video Interface Forum) Profile Q devices |
| tq         | An Allied Telesis TQ Series wireless access point.           |
| other      | Used where the model type is outside the above definitions.  |

**Default** Default to **other**

**Mode** AMF Guest Configuration

**Examples** To assign the model type **tq** to the guest-class called 'tq\_device', use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# modeltype tq
```

To remove the model type **tq** from the guest-class called 'tq\_device', and reset it to the default of **other**, use the commands:

```
node1# configure terminal
node1(config)# atmf guest-class tq_device
node1(config-atmf-guest)# no modeltype
```

**Related commands** [atmf guest-class](#)

**Command changes** Version 5.4.9-2.1: **onvif** parameter added

# service atmf-application-proxy

**Overview** Use this command to enable the AMF Application Proxy service. This service distributes messages across all AMF nodes.

Currently this is used for threat protection. When an AMF Security (AMF-Sec) Controller detects a threat, it issues a request to block the address the threat originated from. The AMF Application Proxy service distributes this message to all AMF nodes. An AMF master accepts this block request and instructs the subordinate AMF node to block the relevant device.

Use the **no** variant of this command to disable the AMF Application Proxy service.

**Syntax** `service atmf-application-proxy`  
`no service atmf-application-proxy`

**Default** The AMF Application Proxy service is disabled by default.

**Mode** Global Configuration

**Usage notes** The AMF master maintains a list of all threats and will send this list to any AMF node, or VCS member, when it boots and joins the AMF network.

In order for this to work the follow must be configured:

- the AMF Application Proxy service on all AMF nodes that need to receive the messages.
- the Hypertext Transfer Protocol (HTTP) service on all nodes that are running the AMF Application Proxy service (see [service http](#)).

**Example** To enable the AMF Application Proxy service, use the commands

```
awplus# configure terminal  
awplus(config)# service atmf-application-proxy
```

To disable the AMF Application Proxy service, use the commands

```
awplus# configure terminal  
awplus(config)# no service atmf-application-proxy
```

**Related commands** [application-proxy threat-protection](#)

**Command changes** Version 5.4.7-2.2: command added

# show application-proxy threat-protection

**Overview** Use this command to list all the IP addresses blocked by the AMF Application Proxy service. It also shows the global threat-detection configuration.

**Syntax** `show application-proxy threat-protection [all]`

| Parameter | Description                               |
|-----------|---|
| all       | Include information for non-local blocks. |

**Mode** Privileged Exec

**Example** To list the addresses blocked by the AMF Application Proxy service, use the command:

```
awplus# show application-proxy threat-protection
```

**Output** Figure 60-9: Example output from **show application-proxy threat-protection**

```
awplus#show application-proxy threat-protection
Quarantine Vlan      : vlan200
Global IP-Filter     : Enabled
IP-Filter Limit Exceeded : 0
Redirect-URL         : http://my.dom/help.html

Client IP           Interface      MAC Address    VLAN    Action
-----

# show application-proxy whitelist interface

**Overview** Use this command to display the status of port authentication on the specified interface.

**Syntax** `show application-proxy whitelist interface [<interface-list>]`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;interface-list&gt;</code> | <p>The interfaces or ports to display information about. An interface-list can be:</p> <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> <p>The specified interface must exist.</p> |

**Mode** Privileged Exec

**Example** To display the port authentication information for all interfaces, use the command:

```
awplus# show application-proxy whitelist interface
```

To display the port authentication information for port1.0.4, use the command

```
awplus# show application-proxy whitelist interface port1.0.4
```

**Output** Figure 60-11: Example output from **show application-proxy whitelist interface**

**Command changes** Version 5.4.9-0.1: command added

# show application-proxy whitelist server

**Overview** Use this command to display the external RADIUS server details for the application-proxy whitelist feature.

**Syntax** `show application-proxy whitelist server`

**Mode** Privileged Exec

**Example** To display the external RADIUS server details for the application-proxy whitelist feature, use the command:

```
awplus# show application-proxy whitelist server
```

**Output** Figure 60-12: Example output from **show application-proxy whitelist server**

```
awplus#show application-proxy whitelist server

Application Proxy Whitelist Details:

External Server Details:
  IP: 192.168.1.10
  Port: 2083
  Protection: TLS
  Trustpoint: None (Authentication disabled)

Proxy Details:
  IP: 172.31.0.5
  Status: Alive
```

**Command changes** Version 5.4.9-0.1: command added

# show application-proxy whitelist supplicant

**Overview** Use this command to display the current configuration and status for each supplicant attached to an application-proxy whitelist port.

**Syntax** `show application-proxy whitelist supplicant [interface <interface-list>|<mac-addr>|brief]`

| Parameter                                  | Description   |
|--|---|
| <code>interface</code><br><interface-list> | The interfaces or ports to display information about. An interface-list can be: <ul style="list-style-type: none"><li>• a switchport (e.g. port1.0.4)</li><li>• a static channel group (e.g. sa2)</li><li>• a dynamic (LACP) channel group (e.g. po2)</li><li>• a continuous range of ports separated by a hyphen (e.g. port1.0.1-1.0.4)</li><li>• a comma-separated list (e.g. port1.0.1,port1.0.3-1.0.4). Do not mix port types in the same list.</li></ul> The specified interface must exist. |
| <mac-addr>                                 | MAC (hardware) address of the supplicant. Entry format is HHHH.HHHH.HHHH (hexadecimal)  |
| brief                                      | Brief summary of the supplicant state.  |

**Mode** Privileged Exec

**Example** To display the supplicant information for all ports, use the command:

```
awplus# show application-proxy whitelist supplicant
```

To display the supplicant information for port1.0.4, use the command:

```
awplus# show application-proxy whitelist supplicant interface  
port1.0.4
```

**Output** Figure 60-13: Example output from **show application-proxy whitelist supplicant**

```

**Command changes** Version 5.4.9-0.1: command added

# show atmf

**Overview** Displays information about the current AMF node.

**Syntax** `show atmf [summary|tech|nodes|session]`

| Parameter | Description   |
|-----------|---|
| summary   | Displays summary information about the current AMF node.  |
| tech      | Displays global AMF information.                          |
| nodes     | Displays a list of AMF nodes together with brief details. |
| session   | Displays information on an AMF session.                   |

**Default** Only summary information is displayed.

**Mode** User Exec and Privileged Exec

**Usage notes** AMF uses internal VLANs to communicate between nodes about the state of the AMF network. Two VLANs have been selected specifically for this purpose. Once these have been assigned, they are reserved for AMF and cannot be used for other purposes

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Example 1** To show summary information on AMF node\_1 use the following command:

```
node_1# show atmf summary
```

**Table 61:** Output from the **show atmf summary** command

```
node_1#show atmf summary
ATMF Summary Information:

ATMF Status           : Enabled
Network Name          : Test_network
Node Name              : node_1
Role                   : Master
Restricted login       : Disabled
Current ATMF Nodes    : 3
```

**Example 2** To show information specific to AMF nodes use the following command:

```
node_1# show atmf nodes
```

**Example 3** The **show amf session** command displays all CLI (Command Line Interface) sessions for users that are currently logged in and running a CLI session.

To display AMF active sessions, use the following command:

```
node_1# show atmf session
```

For example, in the output below, node\_1 and node\_5 have active users logged in.

**Table 62:** Output from the **show atmf session** command

```
node_1#show atmf session

CLI Session Neighbors

Session ID           : 73518
Node Name            : node_1

DBE Request List Length : 0
```

**Example 4** The AMF tech command collects all the AMF commands, and displays them. You can use this command when you want to see an overview of the AMF network.

To display AMF technical information, use the following command:

```
node_1# show atmf tech
```

**Table 63:** Output from the **show atmf tech** command

```
node_1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled

Management ifindex : 4392
Management VLAN      : 4092
```

**Table 64:** Parameter definitions from the **show atmf tech** command

| Parameter    | Definition   |
|--------------|--|
| ATMF Status  | The Node's AMF status, either Enabled or Disabled. |
| Network Name | The AMF network that a particular node belongs to. |

**Table 64:** Parameter definitions from the **show atmf tech** command (cont.)

| Parameter          | Definition   |
|--------------------|--|
| Node Name          | The name assigned to a particular node.  |
| Role               | The role configured for this AMF device, either Master or Member.  |
| Current ATMF Nodes | The count of AMF nodes in an AMF Network.  |
| Node Address       | An address used to access a remotely located node (.atmf).   |
| Node ID            | A unique identifier assigned to a Node on an AMF network.  |
| Node Depth         | The number of nodes in path from this node to level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.   |
| Domain State       | The state of Node in a Domain in AMF network as Controller/Backup.   |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.   |
| Management VLAN    | The VLAN created for traffic between Nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - Network prefix for the subnet.</li> <li>• Management IP Address - The IP address allocated for this traffic.</li> <li>• Management Mask - The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul> |
| Domain VLAN        | The VLAN assigned for traffic between Nodes of same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet. The subnet address used for this traffic.</li> <li>• Domain IP Address. The IP address allocated for this traffic.</li> <li>• Domain Mask. The subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>                 |
| Device Type        | The Product Series name.   |
| ATMF Master        | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not).   |
| SC                 | The device configuration, one of C - Chassis (SBx8100 Series), S - Stackable (VCS) or N - Standalone.  |
| Parent             | The node to which the current node has an active uplink.   |
| Node Depth         | The number of nodes in the path from this node to the master node.   |

**Related commands** [show atmf detail](#)

# show atmf area

**Overview** Use this command to display information about an AMF area. On AMF controllers, this command displays all areas that the controller is aware of. On remote AMF masters, this command displays the controller area and the remote local area. On gateways, this command displays the controller area and remote master area.

**Syntax** `show atmf area [detail] [<area-name>]`

| Parameter   | Description   |
|-------------|---|
| detail      | Displays detailed information   |
| <area-name> | Displays information about master and gateway nodes in the specified area only. |

**Mode** Privileged Exec

**Example 1** To show information about all areas, use the command:

```
controller-1# show atmf area
```

The following figure shows example output from running this command on a controller.

**Table 65:** Example output from the **show atmf area** command on a Controller.

```

controller-1#show atmf area

ATMF Area Information:

* = Local area

Area          Area  Local  Remote  Remote  Node
Name          ID    Gateway Gateway Master   Count
-----
* NZ          1     Reachable  N/A     N/A     3
Wellington   2     Reachable  Reachable  Auth OK  120
Canterbury   3     Reachable  Reachable  Auth Error  -
SiteA-AREA   14    Unreachable  Unreachable  Unreachable  -
Auckland     100   Reachable  Reachable  Auth Start  -
Southland    120   Reachable  Reachable  Auth OK    54

Area count:      6                      Area node count:  177
    
```

The following figure shows example output from running this command on a remote master.

**Table 66:** Example output from the **show atmf area** command on a remote master.

```

Canterbury#show atmf area

  ATMF Area Information:

  * = Local area

  Area          Area  Local      Remote      Remote      Node
  Name          ID   Gateway   Gateway     Master      Count
  -----
  NZ            1    Reachable N/A          N/A         -
  * Canterbury  3    Reachable N/A          N/A         40

  Area count:      2                      Local area node count: 40
    
```

**Table 67:** Parameter definitions from the **show atmf area** command

| Parameter       | Definition  |
|-----------------|---|
| *               | Indicates the area of the device on which the command is being run.   |
| Area Name       | The name of each area.  |
| Area ID         | The ID of the area.   |
| Local Gateway   | Whether the local gateway node is reachable or not.   |
| Remote Gateway  | Whether the remote gateway node is reachable or not. This is one of the following: <ul style="list-style-type: none"> <li>Reachable, if the link has been established.</li> <li>Unreachable, if a link to the remote area has not been established. This could mean that a port or vlan is down, or that inconsistent VLANs have been configured using the <a href="#">switchport atmf-arealink</a> command.</li> <li>N/A for the area of the controller or remote master on which the command is being run, because the gateway node on that device is local.</li> <li>Auth Start, which may indicate that the area names match on the controller and remote master, but the IDs do not match.</li> <li>Auth Error, which indicates that the areas tried to authenticate but there is a problem. For example, the passwords configured on the controller and remote master may not match, or a password may be missing on the remote master.?</li> <li>Auth OK, which indicates that area authentication was successful and you can now use the <a href="#">atmf select-area</a> command.</li> </ul> |
| Remote Master   | Whether the remote master node is reachable or not. This is N/A for the area of the controller or remote master on which the command is being run, because the master node on that device is local.   |
| Node Count      | The number of nodes in the area.  |
| Area Count      | The number of areas controlled by the controller.   |
| Area Node Count | The total number of nodes in the area.  |

**Example 2** To show detailed information about the areas, use the command:

```
controller-1# show atmf area detail
```

The following figure shows example output from running this command.

**Table 68:** Output from the **show atmf area detail** command

```
controller-1#show atmf area detail

ATMF Area Detail Information:

Controller distance      : 0

Controller Id           : 21
Backup Available        : FALSE

Area Id                 : 2

# show atmf area guests

**Overview** This command will display details of all guests that the controller is aware of.

**Syntax** `show atmf area guests [<area-name> [<node-name>]]`

| Parameter   | Description                                       |
|-------------|---|
| <area-name> | The area name for guest information               |
| <node-name> | The name of the node that connects to the guests. |

**Default** n/a

**Mode** User Exec/Privileged Exec

**Example 1** To display atmf area guest nodes on a controller, use the command,

```
GuestNode[1]#show atmf area guests
```

**Output** Figure 60-14: Example output from the **show atmf area guests** command

```
main-building Area Guest Node Information:
Device      MAC                               IP/IPv6

main-building guest node count 4

GuestNode[1]#
```

**Table 69:** Parameters in the output from **show atmf area guests** command

| Parameter   | Description   |
|-------------|---|
| Device Type | The device type as read from the guest node.                        |
| MAC Address | The MAC address of the guest-node                                   |
| Parent      | The device that directly connects to the guest-node                 |
| Port        | The port number on the parent node that connects to the guest node. |
| IP/IPv6     | The IP or IPv6 address of the guest node.                           |

**Related commands**

- show atmf area nodes
- show atmf backup guest
- show atmf area guests-detail

# show atmf area guests-detail

**Overview** This command displays the local and remote guest information from an AMF controller.

**Syntax** `show atmf area guests-detail [<area-name> [<node-name>]]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;area-name&gt;</code> | The name assigned to the AMF area. An area is an AMF network that is under the control of an AMF Controller. |
| <code>&lt;node-name&gt;</code> | The name assigned to the network node.   |

**Default** n/a.

**Mode** Privileged Exec

**Example** To display detailed information for all guest nodes attached to “node1”, which is located within the area named “northern”, use the following command:

```
AMF_controller#show atmf area guests-detail northern node1
```

**Output** Figure 60-15: Example output from the **show atmf guest detail** command.

```
#show atmf guest detail

Node Name           : Node1

```

**Table 70:** Parameters shown in the output of the **show atmf guest detail** command

| Parameter         | Description   |
|-------------------|---|
| Node Name         | The name of the guest's parent node.  |
| Port Name         | The port on the parent node that connects to the guest.   |
| IFindex           | An internal index number that maps to the port number on the parent node.   |
| Guest Description | A brief description of the guest node as manually entered into the <a href="#">description (interface)</a> command for the guest node port on the parent node.                            |
| Device Type       | The device type as supplied by the guest node itself.   |
| Backup Supported  | Indicates whether AMF supports backup of this guest node.   |
| MAC Address       | The MAC address of the guest node.  |
| IP Address        | The IP address of the guest node.   |
| IPv6 Address      | The IPv6 address of the guest node.   |
| HTTP Port         | The HTTP port enables you to specify a port when enabling http to allow a URL for the http user interface of a Guest Node. This is determined by the <a href="#">http-enable</a> command. |
| Firmware Version  | The firmware version that the guest node is currently running.  |

**Related commands** [show atmf area nodes-detail](#)  
[show atmf area guests](#)

# show atmf area nodes

**Overview** Use this command to display summarized information about an AMF controller’s remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes <area-name> [<node-name>]`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;area-name&gt;</code> | Displays information about nodes in the specified area. |
| <code>&lt;node-name&gt;</code> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command lists all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show summarized information for all the nodes in area ‘Wellington’, use the command:

```
controller-1# show atmf area nodes Wellington
```

The following figure shows partial example output from running this command.

**Table 71:** Output from the **show atmf area nodes Wellington** command

```

controller-1#show atmf area nodes Wellington

Wellington Area Node Information:
Node          Device          ATMF          Parent          Node
Name          Type            Master  SC      Domain          Depth
-----
well-gate     x230-18GP       N          N      well-master     1
well-master   AT-x930-28GPX   Y          N      none            0

Wellington node count 2
    
```

**Table 72:** Parameter definitions from the **show atmf area nodes** command

| Parameter   | Definition   |
|-------------|--|
| Node Name   | The name assigned to a particular node.  |
| Device Type | The Product series name.   |
| ATMF Master | Whether the node is an AMF master node for its area ('Y' if it is and 'N' if it is not). |

**Table 72:** Parameter definitions from the **show atmf area nodes** command

| Parameter     | Definition  |
|---------------|---|
| SC            | The device configuration, one of C - Chassis (SBx8100 series), S - Stackable (VCS) or N - Standalone. |
| Parent Domain | The node to which the current node has an active uplink.  |
| Node Depth    | The number of nodes in the path from this node to the master node.                                    |

**Related  
commands**

[show atmf area](#)

[show atmf area nodes-detail](#)

# show atmf area nodes-detail

**Overview** Use this command to display detailed information about an AMF controller's remote nodes.

Note that this command can only be run from a controller node.

**Syntax** `show atmf area nodes-detail <area-name> [<node-name>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;area-name&gt;</code> | Displays detailed information about nodes in the specified area. |
| <code>&lt;node-name&gt;</code> | Displays detailed information about the specified node.          |

**Mode** Privileged Exec

**Usage notes** If you do not limit the output to a single area or node, this command displays information about all remote nodes that the controller is aware of. This can be a very large number of nodes.

**Example** To show information for all the nodes in area 'Wellington', use the command:

```
controller-1# show atmf area nodes-detail Wellington
```

The following figure shows partial example output from running this command.

**Table 73:** Output from the **show atmf area nodes-detail Wellington** command

```
controller-1#show atmf area nodes-detail Wellington

Wellington Area Node Information:
Node name well-gate
Parent node name : well-master
Domain id       : well-gate's domain
Board type      : 368
Distance to core : 1
Flags           : 50
Extra flags     : 0x00000006
MAC Address     : 001a.eb56.9020

Node name well-master
Parent node name : none
Domain id       : well-master's domain
Board type      : 333
Distance to core : 0
Flags           : 51
Extra flags     : 0x0000000c
MAC Address     : eccd.6d3f.fef7

...
```

**Table 74:** Parameter definitions from the **show atmf area nodes-detail** command

| Parameter        | Definition  |
|------------------|---|
| Node name        | The name assigned to a particular node.   |
| Parent node name | The node to which the current node has an active uplink.                              |
| Domain id        | The name of the domain the node belongs to.   |
| Board type       | The Allied Telesis code number for the device.  |
| Distance to core | The number of nodes in the path from the current node to the master node in its area. |
| Flags            | Internal AMF information  |
| Extra flags      | Internal AMF information  |
| MAC Address      | The MAC address of the current node   |

**Related commands** [show atmf area](#)  
[show atmf area nodes](#)

# show atmf area summary

**Overview** Use this command to display a summary of IPv6 addresses used by AMF, for one or all of the areas controlled by an AMF controller.

**Syntax** `show atmf area summary [<area-name>]`

| Parameter                      | Description                                       |
|--------------------------------|---|
| <code>&lt;area-name&gt;</code> | Displays information for the specified area only. |

**Mode** Privileged Exec

**Example 1** To show a summary of IPv6 addresses used by AMF, for all of the areas controlled by controller-1, use the command:

```
controller-1# show atmf area summary
```

The following figure shows example output from running this command.

**Table 75:** Output from the **show atmf area summary** command

```
controller-1#show atmf area summary

ATMF Area Summary Information:

Management Information
Local IPv6 Address           : fd00:4154:4d46:1::15

Area Information
Area Name                    : NZ (Local)
Area ID                      : 1
Area Master IPv6 Address     : -

Area Name                    : Wellington
Area ID                      : 2
Area Master IPv6 Address     : fd00:4154:4d46:2::149

Area Name                    : Canterbury
Area ID                      : 3
Area Master IPv6 Address     : fd00:4154:4d46:3::f

Area Name                    : Auckland
Area ID                      : 100
Area Master IPv6 Address     : fd00:4154:4d46:64::17
Interface                    : vlink2000
```

# show atmf authorization

**Overview** Use this command on an AMF master to display the authorization status of other AMF members and masters on the network.

On an AMF controller this command will show the authorization status of remote area AMF masters.

**Syntax** `show atmf authorization {current|pending|provisional}`

| Parameter   | Description   |
|-------------|---|
| current     | Show the status of all authorized nodes.  |
| pending     | Show the status of unauthorized nodes in the pending queue. These are nodes that enabled secure mode with <code>atmf secure-mode</code> but have not yet been authorized with <code>atmf authorize</code> . |
| provisional | Show the status of provisionally authorized nodes. These are nodes that have been provisioned with <code>atmf authorize provision</code> .  |

**Mode** Privileged Exec

**Example** To display all authorized AMF nodes on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization current
```

To display AMF nodes which are requesting authorization on an AMF controller or AMF master, use the command:

```
awplus# show atmf authorization pending
```

To display AMF nodes which have provisional authorization, use the command:

```
awplus# show atmf authorization provisional
```

**Output** Figure 60-16: Example output from `show atmf authorization current`

| NZ Authorized Nodes: |          |            |
|----------------------|----------|------------|
| Node Name            | Signer   | Expires    |
| -----                | -----    | -----      |
| master_1             | master_1 | 4 Mar 2017 |
| area_1_node_1        | master_1 | 4 Mar 2017 |
| area_1_node_2        | master_1 | 4 Mar 2017 |

Table 60-1: Parameters in the output from **show atmf authorization current**

| Parameter | Description   |
|-----------|---|
| Node Name | AMF node name of the authorized node.   |
| Signer    | Name of the AMF master that authorized the node.  |
| Expires   | Expiry date of the authorization. Authorization expiry time is set using <code>atmf secure-mode certificate expiry</code> . |

**Output** Figure 60-17: Example output from **show atmf authorization pending**

```

Pending Authorizations:

NZ Requests:
Node Name           Product           Parent Node       Interface
-----
area_1_node_3      x230-18GP        master_1          port1.2.9
area_1_node_4      x510-52GTX       master_1          sa1
    
```

Table 60-2: Parameters in the output from **show atmf authorization pending**

| Parameter   | Description  |
|-------------|--|
| Node Name   | Name of the node that is requesting authorization.   |
| Product     | Product name.  |
| Parent Node | Authorization authority of the requesting node.      |
| Interface   | Interface that the authorization request came in on. |

**Output** Figure 60-18: Example output from **show atmf authorization provisional**

```

ATMF Provisional Authorization:

Area - Node Name    Start           Timeout
or MAC Address      Interface       Time            Minutes
-----
3333.4444.5555     5 Sep 2016 02:35:54  3
1111.2222.3333     5 Sep 2016 02:35:24  60
NZ - blue          port1.0.3      5 Sep 2016 02:35:06  60
    
```

Table 60-3: Parameters in the output from **show atmf authorization provisional**

| Parameter                          | Description  |
|------------------------------------|--|
| Area - Node Name<br>or MAC Address | MAC address or node name of the node that has been provisionally authorized. |
| Interface                          | Interface that the node has been provisioned on.                             |
| Start Time                         | Time the node was provisioned.   |
| Timeout Minutes                    | Length of time from Start Time until the provisional authorization expires.  |

changes**

Version 5.4.7-0.3: command added

# show atmf backup

**Overview** This command displays information about AMF backup status for all the nodes in an AMF network. It can only be run on AMF master and controller nodes.

**Syntax**

```
show atmf backup
show atmf backup logs
show atmf backup server-status
show atmf backup synchronize [logs]
```

| Parameter     | Description   |
|---------------|---|
| logs          | Displays detailed log information.  |
| server-status | Displays connectivity diagnostics information for each configured remote file server. |
| synchronize   | Display the file server synchronization status  |
| logs          | For each remote file server, display the logs for the last synchronization            |

**Mode** Privileged Exec

**Example 1** To display the AMF backup information, use the command:

```
node_1# show atmf backup
```

To display log messages to do with backups, use the command:

```
node_1# show atmf backup logs
```

Table 60-4: Output from **show atmf backup**

```
Node_1# show atmf backup
ScheduledBackup .....Enabled
  Schedule.....1 per day starting at 03:00
  Next Backup Time...04 May 2019 03:00
Backup Bandwidth ....Unlimited
Backup Media.....SD (Total 1974.0 MB, Free197.6MB)
Current Action.....Starting manual backup
Started.....04 May 2019 10:08
CurrentNode.....atmf_testbox1
Backup Redundancy ...Enabled
  Local media .....SD (Total 3788.0MB, Free 3679.5MB)
  State .....Active
```

| Node Name     | Date        | Time     | In ATMF | On Media | Status      |
|---------------|-------------|----------|---------|----------|-------------|
| atmf_testbox1 | 04 May 2019 | 09:58:59 | Yes     | Yes      | In Progress |
| atmf_testbox2 | 04 May 2019 | 10:01:23 | Yes     | Yes      | Good        |

Table 60-5: Output from **show atmf backup logs**

```
Node_1#show atmf backup logs

Backup Redundancy ..... Enabled
Local media ..... SD (Total 3788.0MB, Free 1792.8MB)
State ..... Inactive (Remote file server is not available)

Log File Location: card:/atmf/ATMF/logs/rsync_<node name>.log

Node
Name Log Details
-----
atmf_testbox
2019/05/04 18:16:51 [9045] receiving file list
2019/05/04 18:16:51 [9047] .d..t.... flash/
2019/05/04 18:16:52 [9047] >f+++++++ flash/a.rel
```

**Example 2** To display the AMF backup synchronization status, use the command:

```
node_1# show atmf backup synchronize
```

To display log messages to do with synchronization of backups, use the command:

```
node_1# show atmf backup synchronize logs
```

Table 60-6: Output from **show atmf backup synchronize**

```
Node_1#show atmf backup synchronize

ATMF backup synchronization:

* = Active file server

  Id  Date          Time          Status
-----
  1   04 May 2016   22:25:57     Synchronized
* 2   -             -             Active
```

Table 60-7: Output from **show atmf backup synchronize logs**

```
Node_1#show atmf backup synchronize logs

Id    Log Details
-----
1     2019/05/04 22:25:54 [8039] receiving file list
      2019/05/04 22:25:54 [8039] >f..t.... backup_Box1.info
      2019/05/04 22:25:54 [8039] sent 46 bytes received 39 bytes total size 40
```

**Example 3** To display the AMF backup information with the optional parameter **server-status**, use the command:

```
Node_1# show atmf backup server-status
```

```

Node1#sh atmf backup server-status

Id    Last Check    State
-----
1     186 s        File server ready
2     1 s          SSH no route to host
  
```

**Table 61:** Parameter definitions from the **show atmf backup** command

| Parameter         | Definition  |
|-------------------|---|
| Scheduled Backup  | Indicates whether AMF backup scheduling is enabled or disabled.   |
| Schedule          | Displays the configured backup schedule.  |
| Next Backup Time  | Displays the date and time of the next scheduled.   |
| Backup Media      | The current backup medium in use. This will be one of USB, SD, or NONE. Utilized and available memory (MB) will be indicated if backup media memory is present.   |
| Current Action    | The task that the AMF backup mechanism is currently performing. This will be a combination of either (Idle, Starting, Doing, Stopping), or (manual, scheduled).   |
| Started           | The date and time that the currently executing task was initiated in the format DD MMM YYYY HH:MM   |
| Current Node      | The name of the node that is currently being backed up.   |
| Backup Redundancy | Whether backup redundancy is enabled or disabled.   |
| Local media       | The local media to be used for backup redundancy; SD, USB, INTERNAL, or NONE, and total and free memory available on the media.   |
| State             | Whether SD or USB media is installed and available for backup redundancy. May be Active (if backup redundancy is functional—requires both the local redundant backup media and a remote server to be configured and available) or Inactive. |
| Node Name         | The name of the node that is storing backup data - on its backup media.   |
| Date              | The data of the last backup in the format DD MMM YYYY.  |
| Time              | The time of the last backup in the format HH:MM:SS.   |
| In ATMF           | Whether the node shown is active in the AMF network, (Yes or No).   |
| On Media          | Whether the node shown has a backup on the backup media (Yes or No).  |

**Table 61:** Parameter definitions from the **show atmf backup** command (cont.)

| Parameter         | Definition   |
|-------------------|--|
| Status            | The output can contain one of four values: <ul style="list-style-type: none"><li>• “-” meaning that the status file cannot be found or cannot be read.</li><li>• “Errors” meaning that there are issues - note that the backup may still be deemed successful depending on the errors.</li><li>• “Stopped” meaning that the backup attempt was manually aborted.</li><li>• “Good” meaning that the backup was completed successfully.</li><li>• “In Progress” meaning that the backup is currently running on that node.</li></ul> |
| Log File Location | All backup attempts will generate a result log file in the identified directory based on the node name. In the above example this would be:<br>card:/amf/office/logs/rsync_amf_testbox1.log.   |
| Log Details       | The contents of the backup log file.   |
| server-status     | Displays connectivity diagnostics information for each configured remove file server.  |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** [show atmf](#)  
[atmf network-name](#)

# show atmf backup area

**Overview** Use this command to display backup status information for the master nodes in one or more areas.

Note that this command is only available on AMF controllers.

**Syntax** `show atmf backup area [<area-name> [<node-name>]] [logs]`

| Parameter   | Description   |
|-------------|---|
| logs        | Displays the logs for the last backup of each node.     |
| <area-name> | Displays information about nodes in the specified area. |
| <node-name> | Displays information about the specified node.          |

**Mode** Privileged Exec

**Example** To show information about backups for an area, use the command:

```
controller-1# show atmf backup area
```

**Table 62:** Output from the **show atmf backup area** command

```

controller-1#show atmf backup area

Scheduled Backup ..... Enabled

# show atmf backup guest

**Overview** This command displays backup status information of guest nodes in an AMF network. This command can only be run on a device configured as an AMF Master and has an AMF guest license.

**Syntax** show atmf backup guest [*<node-name>*] [*<guest-port>*] [logs]

| Parameter                 | Description                        |
|---------------------------|------------------------------------|
| <i>&lt;node-name&gt;</i>  | The name of parent guest node      |
| <i>&lt;guest-port&gt;</i> | The port number on the parent node |

**Mode** User Exec/Privileged Exec

**Example** On the switch named x930-master, to display information about the AMF backup guest status, use the command:

```
x930-master# show atmf backup guest
```

**Output** Figure 60-19: Example output from **show atmf backup guest**

```

Table 60-1: Parameters in the output from **show atmf backup guest**

| Parameter        | Description  |
|------------------|--|
| Guest Backup     | The status of the guest node backup process  |
| Scheduled Backup | The timing configured for guest backups.   |
| Schedule         | Displays the configured backup schedule.   |
| Next Backup Time | The time the next backup process will be initiated.  |
| Backup Bandwidth | The bandwidth limit applied to the backup data flow measured in kilo Bytes /second. Note that unlimited means there is no limit set specifically for the backup data flow. |
| Backup Media     | Detail of the memory media used to store the backup files and the current memory capacity available.   |

# show atmf container

**Overview** Use this command to display information about the AMF containers created on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `show atmf container [detail] [<container-name>]`

| Parameter        | Description  |
|------------------|--|
| detail           | Show detailed information.   |
| <container-name> | The name of the AMF container you wish to display information for. |

**Mode** Privileged Exec

**Output** Figure 60-20: Example output from **show atmf container**

```
awplus#show atmf container
ATMF Container Information:
  Container      Area      Bridge  State    Memory    CPU%

Table 60-2: Parameters in the output from **show atmf container**

| Parameter | Description  |
|-----------|--|
| Container | Name of the AMF container.   |
| Area      | Name of the area the container is in.  |
| Bridge    | Name of the bridge connecting the container to the physical network.   |
| State     | Container state, <code>running</code> or <code>stopped</code> . This is set with the <code>state</code> command. |
| Memory    | The amount of memory the container is using on the VAA host.   |
| CPU%      | The percentage of CPU time the container is using on the VAA, at the time the show command is run.               |

Figure 60-22: Example output from **show atmf container detail vac-wlg-1**

```
awplus#show atmf container detail vac-wlg-1

ATMF Container Information:

Name: vac-wlg-1
State: RUNNING
PID: 980
IP: 172.31.0.1
IP: 192.168.0.2
IP: fd00:4154:4d46:3c::1
CPU use: 3.95 seconds
Memory use: 67.07 MiB
Memory use: 0 bytes
Link: vethP31UFA
TX bytes: 166.01 KiB
RX bytes: 141.44 KiB
Total bytes: 307.45 KiB
Link: vethYCT7BB
TX bytes: 674.27 KiB
RX bytes: 698.27 KiB
Total bytes: 1.34 MiB
```

Table 60-3: Parameters in the output from **show atmf container detail**

| Parameter | Description  |
|-----------|--|
| Name      | Name of the AMF container.   |
| State     | Container state, <code>RUNNING</code> or <code>STOPPED</code> . This is set with the <code>state</code> command. |

Table 60-3: Parameters in the output from **show atmf container detail** (cont.)

| Parameter   | Description  |
|-------------|--|
| PID         | Internal container id.   |
| IP          | This lists the IP addresses used by the container. These include the eth1 IP address and the AMF management IP address.  |
| CPU use     | The CPU usage of the container since it was enabled.   |
| Memory use  | Container memory usage.  |
| Link        | Each container has two links:<br><ol style="list-style-type: none"><li>1 An AMF area-link, this connects the container to the AMF controller and uses virtual interface eth0 on the AMF container.</li><li>2 A bridged L2 network link, this connects the container to the outside world and uses the virtual interface eth1 on the AMF container.</li></ol> See the <a href="#">AMF Feature Overview and Configuration_Guide</a> for more information on these links. |
| TX/RX bytes | Bytes sent and received on a link.   |
| Total bytes | Total bytes transferred on a link.   |

**Command changes**

Version 5.4.7-0.1: command added

# show atmf detail

**Overview** This command displays details about an AMF node. It can only be run on AMF master and controller nodes.

**Syntax** show atmf detail

| Parameter | Description                       |
|-----------|-----------------------------------|
| detail    | Displays output in greater depth. |

**Mode** Privileged Exec

**Example 1** To display the AMF node1 information in detail, use the command:

```
controller-1# show atmf detail
```

A typical output screen from this command is shown below:

```
atmf-1#show atmf detail
ATMF Detail Information:

Network Name           : Test_network
Network Mtu           : 1300
Node Name              : controller-1
Node Address           : controller-1.atmf
Node ID               : 342
Node Depth             : 0
Domain State           : BackupDomainController
Recovery State         : None
Recovery Over ETH Ports : Disabled
Log Verbose Setting    : Verbose
Topology GUI           : Disabled

Management VLAN
VLAN ID                : 4000
Management Subnet     : 172.31.0.0
Management IP Address  : 172.31.1.86
Management Mask        : 255.255.128.0
Management IPv6 Address : fd00:4154:4d46:1::156
Management IPv6 Prefix Length : 64

Domain VLAN
VLAN ID                : 4091
Domain Subnet          : 172.31.128.0
Domain IP Address      : 172.31.129.86
Domain Mask            : 255.255.128.0
```

**Table 61:** Parameter definitions from the **show atmf detail** command

| Parameter               | Definition   |
|-------------------------|--|
| Network MTU             | The network MTU for the ATMF network.  |
| Network Name            | The AMF network that a particular node belongs to.   |
| Node Name               | The name assigned to a particular node.  |
| Node Address            | An address used to access a remotely located node. This is simply the Node Name plus the dotted suffix atmf (.atmf).   |
| Node ID                 | A unique identifier assigned to a node on an AMF network.  |
| Node Depth              | The number of nodes in the path from this node to the level of the AMF root node. It can be thought of as the vertical depth of the AMF network from a particular node to the zero level of the AMF root node.   |
| Domain State            | The state of a node in a Domain in an AMF network as Controller/Backup.  |
| Recovery State          | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - Auto, Manual, or None.   |
| Recovery Over ETH Ports | Allow AMF recovery over the Eth port on an AR-series device.   |
| Log Verbose Setting     | The state of the <code>atmf log-verbose</code> command.  |
| Topology GUI            | This feature allows your AMF network to interact with Vista Manager EX and must be enabled on your AMF master.   |
| Management VLAN         | The VLAN created for traffic between nodes of different domain (up/down links). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4092 is configured as the Management VLAN.</li> <li>• Management Subnet - the network prefix for the subnet.</li> <li>• Management IP Address - the IP address allocated for this traffic.</li> <li>• Management Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul> |
| Domain VLAN             | The VLAN assigned for traffic between nodes of the same domain (crosslink). <ul style="list-style-type: none"> <li>• VLAN ID - in this example VLAN 4091 is configured as the domain VLAN.</li> <li>• Domain Subnet - the subnet address used for this traffic.</li> <li>• Domain IP Address - the IP address allocated for this traffic.</li> <li>• Domain Mask - the subnet mask used to create a subnet for this traffic (255.255.128.0).</li> </ul>              |
| Node Depth              | The number of nodes in the path from this node to the core domain.   |

# show atmf group

**Overview** This command can be used to display the group membership within to a particular AMF node. It can also be used with the working-set command to display group membership within a working set.

Each node in the AMF is automatically added to the group that is appropriate to its hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group.

You can create arbitrary groups of AMF members based on your own selection criteria. You can then assign commands collectively to any of these groups.

**Syntax** `show atmf group [user-defined|automatic]`

| Parameter                 | Description                             |
|---------------------------|---|
| <code>user-defined</code> | User-defined-group information display. |
| <code>automatic</code>    | Automatic group information display.    |

**Default** All groups are displayed

**Mode** Privileged Exec

**Example 1** To display group membership of node2, use the following command:

```
node2# show atmf group
```

A typical output screen from this command is shown below:

```
ATMF group information

master, x510

node2#
```

This screen shows that node2 contains the groups **master** and **x510**. Note that although the node also contains the implicit groups, these do not appear in the show output.

**Example 2** The following commands (entered on *node2*) will display all the automatic groups within the working set containing *node1* and all nodes that have been pre-defined to contain the *sysadmin* group:

First define the working-set:

```
node1# #atmf working-set node1 group sysadmin
```

A typical output screen from this command is shown below:

```

ATMF group information

master, poe, x8100

=====
node1, node2, node3, node4, node5, node6:
=====

ATMF group information

sysadmin, x8100

AMF_NETWORK[6]#
    
```

This confirms that the six nodes (*node1* to *node6*) are now members of the working-set and that these nodes reside within the *AMF-NETWORK*.

Note that to run this command, you must have previously entered the command [atmf working-set](#) on page 3184. This can be seen from the network level prompt, which in this case is *AMF\_NETWORK[6]#*.

**Table 62:** Sample output from the **show atmf group** command for a working set.

```

AMF_NETWORK[6]#show atmf group
=====
node3, node4, node5, node6:
=====

ATMF group information

edge_switches, x510
    
```

**Table 63:** Parameter definitions from the **show atmf group** command for a working set

| Parameter              | Definition  |
|------------------------|---|
| ATMF group information | Displays a list of nodes and the groups that they belong to, for example: <ul style="list-style-type: none"> <li>• master - Shows a common group name for Nodes configured as AMF masters.</li> <li>• Hardware Arch - Shows a group for all Nodes sharing a common Hardware architecture, e.g. x8100, x230, for example.</li> <li>• User-defined - Arbitrary groups created by the user for AMF nodes.</li> </ul> |

# show atmf group members

**Overview** This command will display all group memberships within an AMF working-set. Each node in the AMF working set is automatically added to automatic groups which are defined by hardware architecture, e.g. x510, x230. Nodes that are configured as masters are automatically assigned to the master group. Users can define arbitrary groupings of AMF members based on their own criteria, which can be used to select groups of nodes.

**Syntax** `show atmf group members [user-defined|automatic]`

| Parameter    | Description                            |
|--------------|--|
| user-defined | User defined group membership display. |
| automatic    | Automatic group membership display.    |

**Mode** Privileged Exec

**Example** To display group membership of all nodes in a working-set, use the command:

```
ATMF_NETWORK[9]# show atmf group members
```

**Table 64:** Sample output from the `show atmf group members` command

```
ATMF Group membership
Automatic          Total
Groups            Members  Members
-----
master            1        Building_1
poe               1        HW_Team1
x510              3        SW_Team1 SW_Team2 SW_Team3
x930              1        HW_Team1
x8100             2        Building_1 Building_2

ATMF Group membership
User-defined       Total
Groups            Members  Members
-----
marketing         1        Bld1_Floor_1
software          3        SW_Team1 SW_Team2 SW_Team3
```

**Table 65:** Parameter definitions from the **show atmf group members** command

| Parameter           | Definition   |
|---------------------|--|
| Automatic Groups    | Lists the Automatic Groups and their nodal composition. The sample output shows AMF nodes based on the same Hardware type or belonging to the same Master group. |
| User-defined Groups | Shows the grouping of AMF nodes in user defined groups.  |
| Total Members       | Shows the total number of members in each group.   |
| Members             | Shows the list of AMF nodes in each group.   |

**Related commands**

- [show atmf group](#)
- [show atmf](#)
- [atmf group \(membership\)](#)

# show atmf guests

**Overview** This command is available on any AMF master or controller in the network. It displays a summary of the AMF guest nodes that exist in the AMF network, including device type, parent node, and IP address.

**Syntax** show atmf guests

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display all guest nodes in a network. If you want to see only the guests attached to a single node, use the [show atmf links guest](#) command, which shows information about the guest nodes and also about their link to their parent node.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests
```

**Output** Figure 60-23: Example output from the **show atmf guests** command

```
master#show atmf guests

Guest Information:

Device      Device      Parent      Guest      IP/IPv6
Name        Type        Node        Port        Address
-----
node1-2.0.1 x600-24Ts   node1       2.0.1       192.168.2.10
wireless-zone1 AT-TQ4600   node2       1.0.1       192.168.1.10
wireless-zone2 AT-TQ4600   node2       1.0.2       192.168.1.12

Current ATMF guest node count 3
```

**Table 66:** Parameters shown in the output of the **show atmf guests** command

| Parameter   | Description  |
|-------------|--|
| Device Name | The name that is discovered from the device, or failing that, a name that is auto-assigned by AMF. The auto-assigned name consists of: <parent node name>-<attached port number> You can change this by configuring a description on the port.     |
| Device Type | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command. |

**Table 66:** Parameters shown in the output of the **show atmf guests** command

| Parameter       | Description  |
|-----------------|--|
| Parent Node     | The name of the AMF node that directly connects to the guest node.                                 |
| Guest Port      | The port on the parent node that directly connects to the guest node.                              |
| IP/IPv6 Address | The address discovered from the node, or statically configured on the parent node's attached port. |

**Related  
commands**

[atmf guest-class](#)  
[switchport atmf-guestlink](#)  
[show atmf backup guest](#)  
[show atmf links guest](#)

# show atmf guests detail

**Overview** This command is available on any AMF master in the network. It displays details about the AMF guest nodes that exist in the AMF network, such as device type, IP address, MAC address etc.

**Syntax** `show atmf guests detail [<node-name>] [<guest-port>]`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;node-name&gt;</code>  | The name of the guest node's parent. |
| <code>&lt;guest-port&gt;</code> | The port name on the parent node.    |

**Mode** User Exec/Privileged Exec

**Usage notes** If you want to see only the guests attached to a single node, you can use either:

- this command and specify the node name, or
- [show atmf links guest detail](#), which shows information about the guest nodes and also about their link to their parent node.

Note that the parameters that are displayed depend on the guest node's model.

**Example** To display the AMF guest output, use the command:

```
awplus# show atmf guests detail
```

**Output** Figure 60-24: Example output from **show atmf guests detail**

```
master#show atmf guests detail

ATMF Guest Node Information:

Node Name           : master

| IP Address        | : 192.168.5.6    |
| IPv6 Address      | : Not Set        |
| HTTP Port         | : 80             |
| Firmware Version  | : 3.1.0 B01      |

**Table 67:** Parameters in the output from **show atmf guests detail**.

| Parameter         | Description  |
|-------------------|--|
| Node Name         | The name of the parent node, which is the AMF node that directly connects to the guest node.   |
| Port Name         | The port on the parent node that connects to the guest.  |
| IfIndex           | An internal index number that maps to the port number on the parent node.  |
| Guest Description | A description that is discovered from the device, or failing that, auto-assigned by AMF. The auto-assigned name consists of:<br><parent node name>-<attached port number>.<br>You can change this by configuring a description on the port.        |
| Device Type       | The product name of the guest node, which is discovered from the device. If no device type can be discovered, this shows the name of the AMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command. |
| Username          | The user name configured on the guest node.  |
| Backup Supported  | Whether the guest node supports AMF backup functionality.  |
| MAC Address       | The MAC address of the guest node.   |
| IP Address        | The IP address of the guest node.  |
| IPv6 Address      | The IPv6 address of the guest node.  |
| Firmware Version  | The version of the firmware operating on the guest node.   |
| HTTP port         | The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).                      |

**Related  
commands**    [atmf guest-class](#)  
                  [switchport atmf-guestlink](#)  
                  [show atmf backup guest](#)

# show atmf links

**Overview** This command displays information about AMF links on a switch. The display output contains link status state information.

**Syntax** `show atmf links [brief]`

| Parameter | Description   |
|-----------|---|
| brief     | A brief summary of AMF links, their configuration and status. |

**Mode** User Exec and Privileged Exec

**Usage notes** The **show atmf links** and **show atmf links brief** commands both produce a table of summarized link information. For a more detailed view use the [show atmf links detail](#) command.

This command does not show links that are configured on provisioned ports.

**Example** To display a brief summary of the AMF links, use the following command:

```
node-1# show atmf links brief
```

Figure 60-25: Example output from **show atmf links brief**

```
Example-core# show atmf links
ATMF Link Brief Information:
Local      Link      Link      ATMF      Adjacent      Adjacent      Link

* = Provisioned.
```

Table 60-1: Parameter in the output from **show atmf links brief**

| Parameter   | Definition   |
|-------------|--|
| Local Port  | Shows the local port on the selected node.   |
| Link Type   | Shows link type as Uplink or Downlink (parent and child) or Cross-link (nodes in same domain). |
| Link Status | Shows the link status of the local port on the node as either Up or Down.                      |

Table 60-1: Parameter in the output from **show atmf links brief** (cont.)

| Parameter         | Definition  |
|-------------------|---|
| ATMF State        | Shows AMF state of the local port: <ul style="list-style-type: none"> <li>• Init - Link is down.</li> <li>• Hold - Link transitioned to up state, but waiting for hold period to ensure link is stable.</li> <li>• Incompatible - Neighbor rejected the link because of inconsistency in AMF configurations.</li> <li>• OneWay - Link is up and has waited the hold down period and now attempting to link to another unit in another domain.</li> <li>• OneWaySim - Device is running in secure mode and link is up but waiting for authorization from an AMF master.</li> <li>• Full - Link hello packets are sent and received from its neighbor with its own node id.</li> <li>• Shutdown - Link has been shut down by user configuration.</li> </ul> |
| Adjacent Node     | Shows the Adjacent AMF Node to the one being configured.  |
| Adjacent IF Index | Shows the IF index for the Adjacent AMF Node connected to the node being configured.  |
| Link State        | Shows the state of the AMF link. Valid states are either Forwarding or Blocking.  |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

# show atmf links detail

**Overview** This command displays detailed information on all the links configured in the AMF network. It can only be run on AMF master and controller nodes.

**Syntax** `show atmf links detail`

| Parameter | Description                     |
|-----------|---------------------------------|
| detail    | Detailed AMF links information. |

**Mode** User Exec

**Usage notes** For summarized link information see the [show atmf links](#) command.  
This command does not show links that are configured on provisioned ports.

**Example** To display the AMF link details use this command:

```
device1# show atmf links detail
```

The output from this command will display all the internal data held for AMF links. The following example gives details of the links that are summarized in the example in [show atmf links](#).

**Table 61:** Sample output from the **show atmf links detail** command

```
device1# show atmf links detail
-----
Crosslink Ports Information

**Table 62:** Parameter definitions from the **show atmf links detail** command output (cont.)

| Parameter                     | Definition  |
|-------------------------------|---|
| Node Transaction List         | <p>List of transactions from this downlink domain node.</p> <ul style="list-style-type: none"> <li>• Node - 0 links are not blocked to the domain. 1 All links are blocked to the domain.</li> <li>• Transaction ID - Transaction id for this node.</li> <li>• Domain List: Shows list of nodes in the current domain and their links to the downlink domain.:</li> <li>• Domain - Domain name of the downlink node.</li> <li>• Node - Name of the node in the current domain.</li> <li>• Ifindex - Interface index for the link from the node to the downlink domain.</li> <li>• Transaction ID - Transaction id of the node in the current domain.</li> <li>• Flags - As mentioned above.</li> </ul>  |
| Up/Downlink Ports Information | <p>Shows all the configured up and down link ports on this node:</p> <ul style="list-style-type: none"> <li>• Port - Name of the local port.</li> <li>• Ifindex - Interface index of the local port.</li> <li>• VR ID - Virtual router id for the local port.</li> <li>• Port Status - Shows status of the local port on the Node as UP/DOWN.</li> <li>• Port State - AMF state of the local port.</li> <li>• Adjacent Node - nodename of the adjacent node.</li> <li>• Adjacent Internal ID - Unique node identifier of the remote node.</li> <li>• Adjacent Ifindex - Interface index for the port of adjacent AMF node.</li> <li>• Adjacent Board ID - Product identifier for the adjacent node.</li> <li>• Adjacent VR ID - Virtual router id for the port on adjacent AMF node.</li> <li>• Adjacent MAC - MAC address for the port on adjacent AMF node.</li> <li>• Adjacent Domain Controller - nodename of the Domain controller for Adjacent AMF node.</li> <li>• Adjacent Domain Controller MAC - MAC address of the Domain controller for Adjacent AMF node.</li> <li>• Port Forwarding State - Local port forwarding state Forwarding or Blocking.</li> <li>• Port BPDU Receive Count - count of AMF protocol PDU's received.</li> <li>• Port Sequence Number - hello sequence number, incremented every time the data in the hello packet changes.</li> <li>• Port Adjacent Sequence Number - remote ends sequence number used to check if we need to process this packet or just note it arrived.</li> <li>• Port Last Message Response - response from the remote neighbor to our last hello packet.</li> </ul> |

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** no debug all  
clear atmf links statistics  
show atmf

# show atmf links guest

**Overview** This command displays information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest [interface <interface-range>]`

| Parameter                      | Description  |
|--------------------------------|--|
| interface<br><interface-range> | Select a specific range of ports to display information about guest nodes. |

**Default** With no parameters specified this command will display its standard output for all ports with guest nodes connected.

**Mode** User Exec/Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests](#).

**Example 1** To display information about AMF guests that are connectible from node1, use the command:

```
node1# show atmf links guest
```

**Output** Figure 60-26: Example output from **show atmf links guest**

```
node1#sh atmf links guest

Guest Link Information:

DC = Discovery configuration
S = static D = dynamic

Local   Guest      Model      MAC      IP / IPv6
Port   Class      Type       DC Address Address
-----
1.0.1   -          other      D 0013.1a1e.4589 192.168.1.2
1.0.2   aastra-phone other      D 0008.5d10.7635 192.168.1.3
1.0.3   cisco-phone2 other      S -              192.168.2.1
1.0.4   panasonic... other      D 0800.239e.f1fe 192.168.1.5
```

Table 60-1: Parameters in the output from **show atmf links guest**

| Parameter   | Description  |
|-------------|--|
| Local Port  | The port on the parent node that connects to the guest.  |
| Guest Class | The name of the ATMF guest-class that has been assigned to the guest node by the <a href="#">atmf guest-class</a> command. |

Table 60-1: Parameters in the output from **show atmf links guest** (cont.)

| Parameter         | Description  |
|-------------------|--|
| Model Type        | The model type of the guest node, as entered by the <code>modeltype</code> command. Can be one of the following: <ul style="list-style-type: none"><li>• alliedware</li><li>• aw+</li><li>• tq</li><li>• other</li></ul> |
| DC                | The discovery method as applied by the <code>discovery</code> command. This can be either dynamic (D) or static (S).   |
| MAC Address       | The MAC address of the guest node.   |
| IP / IPv6 Address | The IP address of the guest node.  |

**Related commands**

- `atmf guest-class`
- `discovery`
- `http-enable`
- `username`
- `modeltype`
- `switchport atmf-guestlink`
- `show atmf backup guest`

# show atmf links guest detail

**Overview** This command displays detailed information about guest nodes visible to an AMF device.

**Syntax** `show atmf links guest detail [interface <interface-range>]`

| Parameter  | Description  |
|--|--|
| <code>interface</code><br><code>&lt;interface-range&gt;</code> | Select a specific range of ports to display information about guest nodes. |

**Mode** User Exec and Privileged Exec

**Usage notes** Use this command to display the guest nodes connected to a single parent node. If you want to see a list of all the guests in the AMF network, use [show atmf guests detail](#).

Note that the parameters that are displayed depend on the guest node's model and state.

**Example** To display detailed information about AMF guests, use the command:

```
node1# show atmf links guest detail
```

**Output** Figure 60-27: Example output from **show atmf links guest detail**

```

node1#show atmf links guest detail

Table 60-2: Parameters in the output from **show atmf links guest detail**

| Parameter  | Description   |
|------------|---|
| Interface  | The port on the parent node that connects to the guest.   |
| Link State | The state of the link to the guest node; one of: <ul style="list-style-type: none"> <li>Down: The physical link is down.</li> <li>Up: The physical link has come up, but it is still during a timeout period that is enforced to allow other links to come up.</li> <li>Learn: The timeout period described above has elapsed, and the link is now learning information from the AMF guest node. You can see what information it is learning from the "Node State" field below.</li> <li>Full: The node connected by this link has joined the AMF network.</li> <li>Fail: The port is physically up but something has prevented the guest node from joining the AMF network.</li> </ul> |
| Class Name | The name of the ATMF guest-class that has been assigned to the guest node by the <code>atmf guest-class</code> command.   |

Table 60-2: Parameters in the output from **show atmf links guest detail** (cont.)

| Parameter        | Description   |
|------------------|---|
| Model Type       | The model type of the guest node, as entered by the <code>modeltype</code> command. The mode type can be one of the following: <ul style="list-style-type: none"> <li>• alliedware</li> <li>• aw+</li> <li>• onvif</li> <li>• tq</li> <li>• other</li> </ul>  |
| Discovery Method | The discovery method as applied by the <code>discovery</code> command. This can be either dynamic or static.  |
| IP Address       | The IP address of the guest node.   |
| Username         | The user name configured on the guest node.   |
| Login Fallback   | Whether the guest node supports Login Fallback. For TQ model guest nodes, when login fallback is enabled, if a guest node is replaced, then AMF logs in to the new TQ using the factory default manager/friend settings. The new TQ is then discovered and managed as an AMF guest node by an AMF master or member. This means any backed up settings for the replaced guest node can also be recovered.  |
| Node state       | The state of the guest node; one of: <ul style="list-style-type: none"> <li>• Down: The initial state when a link to a guest node is first configured. This is also the state if the physical link goes down.</li> <li>• Getting IP: The AMF device is in the process of retrieving the IP address of the guest node.</li> <li>• Getting Mac: The AMF device is in the process of retrieving the MAC address of the guest node.</li> <li>• Getting Info: The AMF device is in the process of retrieving any other available information from the guest (firmware version etc). The information available depends on what device the guest node is.</li> <li>• Full: The AMF device has retrieved all necessary information and the guest node has joined the AMF network. Once this state is reached, the Link State also changes to "Full".</li> <li>• Failure: The physical link is up but the AMF member has failed to retrieve enough information to allow the guest node to join the AMF network.</li> </ul> |
| Backup Supported | Whether the guest node supports AMF backup functionality.   |
| MAC Address      | The MAC address of the guest node.  |

Table 60-2: Parameters in the output from **show atmf links guest detail** (cont.)

| Parameter        | Description   |
|------------------|---|
| Device Type      | Model information for the guest node. This field shows the model information that AMF retrieved from the guest node. In contrast, the Model Type shows what a user entered as the type of device they intended this guest node to be. |
| Description      | By default, this is a concatenation of the guest node's parent node and the port to which it is attached. You can change it by configuring a description on the port.   |
| Serial Number    | The serial number of the guest node.  |
| Firmware Name    | The name of the firmware operating on the guest node.   |
| Firmware Version | The version of the firmware operating on the guest node.  |
| HTTP port        | The HTTP port as specified with the <a href="#">http-enable</a> command when defining a guest class. You can set this if the guest node provides an HTTP user interface on a non-standard port (any port other than port 80).         |

**Command changes**

Version 5.5.0-1.1: **Login Fallback** parameter added

# show atmf links statistics

**Overview** This command displays details of the AMF links configured on the device and also displays statistics about the AMF packet exchanges between the devices.

It is also possible to display the AMF link configuration and packet exchange statistics for a specified interface.

This command can only be run on AMF master and controller nodes

**Syntax** `show atmf links statistics [interface [<port-number>]]`

| Parameter     | Description  |
|---------------|--|
| interface     | Specifies that the command applies to a specific interface (port) or range of ports. Where both the interface and port number are unspecified, full statistics (not just those relating to ports) will be displayed.     |
| <port-number> | Enter the port number for which statistics are required. A port range, a static channel or LACP link can also be specified. Where no port number is specified, statistics will be displayed for all ports on the device. |

**Mode** User Exec

**Example 1** To display AMF link statistics for the whole device, use the command:

```
device1# show atmf links statistics
```

**Table 61:** Sample output from the **show atmf links statistics** command

```
ATMF Statistics:

port1.0.4  Arealink Hello                   0         0
    
```

Figure 60-29: Parameter definitions from the **show atmf links statistics** command output

| Parameter            | Definition   |
|----------------------|--|
| Receive              | Shows a count of AMF protocol packets received per message type.       |
| Transmit             | Shows the number of AMF protocol packets transmitted per message type. |
| Database Entries     | Shows the number of AMF elements existing in the distributed database. |
| Database Full Ages   | Shows the number of times the entries aged in the database.            |
| ATMF Packet Discards | Shows the number of discarded packets of each type.                    |

# show atmf nodes

**Overview** This command displays nodes currently configured within the AMF network.

Note that the output also tells you whether or not node map exchange is active. Node map exchange improves the tracking of nodes joining and leaving an AMF network. This improves the efficiency of AMF networks. Node map exchange is only available if every node in your AMF network is running version 5.4.6-2.1 or later. We recommend running the latest version on all nodes in your network, so you receive the advantages of node map exchange and other improvements.

**Syntax** `show atmf nodes [guest|all]`

| Parameter | Description  |
|-----------|--|
| guest     | Display only guest nodes in the AMF network.                 |
| all       | Display all nodes in the AMF network, including guest nodes. |

**Mode** Privileged Exec

**Usage notes** You can use this command to display one of three sets of nodes:

- all nodes except guest nodes, by specifying **show atmf nodes**
- all nodes including guest nodes, by specifying **show atmf nodes all**
- only guest nodes, by specifying **show atmf nodes guest**

**Examples** To display AMF information for all nodes except guest nodes, use the command:

```
node1# show atmf nodes
```

Table 60-1: Sample output from **show atmf nodes**

```
node1#show atmf nodes guest

Node Information:

* = Local device

SC = Switch Configuration:
C = Chassis   S = Stackable   N = Standalone

Node          Device          ATMF          Parent          Node
Name          Type            Master SC          Domain          Depth
-----
* M1          x510-28GTX      Y             S              none            0
N3            x230-18GP       N             N              M1              1
N1            AR4050S         N             N              M1              1

Node map exchange is active
Current ATMF node count 3
```

To display AMF information for all nodes, including guest nodes, use the command:

```
node1# show atmf nodes all
```

**Table 61:** Sample output from **show atmf nodes all**. In this example, not all nodes support node map exchange, as shown by the message at the end

```
node1#show atmf nodes all

Node and Guest Information:

* = Local device

SC = Switch Configuration:
C = Chassis  S = Stackable  N = Standalone G = Guest

Node/Guest      Device          ATMF          Parent          Node
Name            Type            Master SC    Domain          Depth
-----
* M1             x510-28GTX     Y      S    none           0
N3              x230-18GP     N      N    M1             1
N1              AR4050S       N      N    M1             1
N3-1.0.24       AT-TQ4600     N      G    N3             -

Node map exchange is inactive
Firmware on some nodes does not support node map exchange, eg AR4050S
Current ATMF node count 4 (guests 1)
```

To display AMF information for guest nodes only, use the command:

```
node1# show atmf nodes guest
```

**Table 60-1:** Sample output from **show atmf nodes guest**

```
node1#show atmf nodes guest

Guest Information:
Device      MAC
Name        Address      Parent          Port          IP/IPv6
Address
-----
aastra-...  0008.5d10.7635 Node-1          1.0.2         192.168.4.7
poe-1.0.1   0013.1a1e.4589 Node-1          1.0.1         192.168.4.6
ip-camera   0800.239e.f1fe Node-1          1.0.4         192.168.4.8
tq4600      eccd.6df2.da60 Node-1          1.0.5         192.168.4.50
```

# show atmf provision nodes

**Overview** This command displays information about each provisioned node with details about date and time of creation, boot and configuration files available in the backup, and license files present in the provisioned backup. This includes nodes that have joined the network but are yet to run their first backup.

This command can only be run on AMF master and controller nodes.

**Syntax** `show atmf provision nodes`

**Mode** Privileged Exec

**Usage notes** This command will only work if provisioned nodes have already been set up. Otherwise, an error message is shown when the command is run.

**Example** To show the details of all the provisioned nodes in the backup use the command:

```
NodeName# show atmf provision nodes
```

Figure 60-30: Sample output from the **show atmf provision nodes** command

```
device1#show atmf provision nodes

ATMF Provisioned Node Information:

Backup Media .....: SD (Total 3827.0MB, Free 3481.1MB)

Node Name           : device2
Date& Time          : 06-Oct-2016 & 23:25:44

# show atmf recovery-file

**Overview** Use this command to display the recovery file information for an AMF node. AMF recovery files are created for nodes with special links. Special links include:

- virtual links,
- area links terminating on an AMF master, and
- area virtual links terminating on an AMF master.

**Syntax** `show atmf recovery-file`

**Mode** Privileged Exec

**Example** To display recovery file information for an AMF node, use the command:

```
node1# show atmf recovery-file
```

**Output** Figure 60-31: Example output from **show atmf recovery-file**

```
node1#show atmf recovery-file

ATMF Recovery File Info: Special Link Present

# show atmf secure-mode certificates

**Overview** Use this command to display the certificate status details when secure mode is enabled on an AMF network.

**Syntax** `show atmf secure-mode certificates [detail] [area <area-name>]  
[node <node-name>]`

| Parameter   | Description   |
|-------------|---|
| detail      | Display detailed certificate information.                     |
| area        | Specify an AMF area.  |
| <area-name> | The AMF area you want to see the certificate information for. |
| node        | Specify an AMF node.  |
| <node-name> | The AMF node you want to see information for.                 |

**Mode** Privileged Exec

**Example** To display AMF secure mode certificates on a master or member node, use the command:

```
awplus# show atmf secure-mode certificates
```

To display detailed information about AMF secure mode certificates for a node named "area\_2\_node\_1" in an area named "area-2", use the command:

```
awplus# show atmf secure-mode certificates detail area area-2  
node area_2_node_1
```

**Output** Figure 60-36: Example output from **show atmf secure-mode certificates**

```
Area-1 Certificates:
Node Name          Signer             Expires            Status
-----
area_1_node_1     master_1           11 Mar 2017
                  master_2           4 Mar 2017        Active
area_1_node_2     master_1           11 Mar 2017
                  master_2           4 Mar 2017        Revoked

Area-2 Certificates:
Node Name          Signer             Expires            Status
-----
area_2_node_1     master_1           18 Mar 2017        Active
area_2_node_2     master_1           18 Mar 2017        Rejected
```

Table 60-5: Parameters in the output from **show atmf secure-mode certificates**

| Parameter | Description   |
|-----------|---|
| Node Name | Name of AMF node the certificate was issued to.   |
| Signer    | Name of AMF master that issued the certificate.   |
| Expires   | Certificate expiry date.  |
| Status    | The status column will display <i>Active</i> before a member node is trusted, and can be accessed using AMF commands. Valid statuses are <i>Active</i> , <i>Revoked</i> , and <i>Rejected</i> . |

**Output** Figure 60-37: Example output from **show atmf secure-mode certificates detail area area-2 node area\_2\_node\_1**

```
Certificates Detail:
-----
area_2_node_1 (area:area-2)
  MAC Address      : 0000.cd37.0003

  Expiry Date      : 18 Mar 2017 21:17:42
```

Table 60-6: Parameters in the output from **show atmf secure-mode certificates detail**

| Parameter       | Description  |
|-----------------|--|
| MAC Address     | MAC address of AMF node.   |
| Status          | The device status will show <i>Active</i> if a member node is trusted, and can be accessed using AMF commands. Valid statuses are <i>Active</i> , <i>Revoked</i> , and <i>Rejected</i> . |
| Serial Number   | Device serial number.  |
| Product         | Device product type.   |
| Key Fingerprint | AMF node key fingerprint.  |
| Flags           | Internal AMF information.  |
| Signer          | Name of AMF master that issued the certificate.  |
| Expiry Date     | Certificate expiry date.   |

**Command changes** Version 5.4.7-0.3: command added

# show atmf secure-mode sa

**Overview** Use this command to display the security associations on the network. This is the list of links and neighbors that are trusted.

**Syntax** `show atmf secure-mode sa [detail] [link|neighbor|broadcast]`

| Parameter | Description  |
|-----------|--|
| detail    | Display detailed security association information. |
| link      | Display security associations for type links.      |
| neighbor  | Display security associations for type neighbors.  |
| broadcast | Display security associations for type broadcast.  |

**Mode** Privileged Exec

**Example** To display an overview of AMF secure mode security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa
```

To display a detailed overview of AMF secure mode neighbor security associations on a master or member node, use the command:

```
awplus# show atmf secure-mode sa detail neighbor
```

**Output** Figure 60-38: Example output from **show atmf secure-mode sa**

```
ATMF Security Associations:
```

| Type                 | State         | ID       | Details    |

# show atmf tech

**Overview** This command collects and displays all the AMF command output. The command can thus be used to display a complete picture of an AMF network.

**Syntax** show atmf tech

**Mode** Privileged Exec

**Example** To display output for all AMF commands, use the command:

```
NodeName# show atmf tech
```

**Table 61:** Sample output from the **show atmf tech** command.

```
node1#show atmf tech
ATMF Summary Information:

ATMF Status           : Enabled

| Number of Up Uplinks              | : 0     |
| Number of Up Uplinks on This Node | : 0     |
| DBE Checksum                      | : 84fc6 |
| Number of DBE Entries             | : 0     |
| ...                               |         |

**Table 62:** Parameter definitions from the **show atmf tech** command

| Parameter          | Definition   |
|--------------------|--|
| ATMF Status        | Shows status of AMF feature on the Node as Enabled/Disabled.   |
| Network Name       | The name of the AMF network to which this node belongs.  |
| Node Name          | The name assigned to the node within the AMF network.  |
| Role               | The role configured on the device within the AMF - either master or member.  |
| Current ATMF Nodes | A count of the AMF nodes in the AMF network.   |
| Node Address       | The identity of a node (in the format name.atmf) that enables its access it from a remote location.  |
| Node ID            | A unique identifier assigned to an AMF node.   |
| Node Depth         | The number of nodes in the path from this node to the core domain.   |
| Domain State       | A node's state within an AMF Domain - either controller or backup.   |
| Recovery State     | The AMF node recovery status. Indicates whether a node recovery is in progress on this device - either Auto, Manual, or None.  |
| Management VLAN    | The VLAN created for traffic between nodes of different domains (up/down links).<br>VLAN ID - In this example VLAN 4092 is configured as the Management VLAN.<br>Management Subnet - the Network prefix for the subnet.<br>Management IP Address - the IP address allocated for this traffic.<br>Management Mask - the Netmask used to create a subnet for this traffic 255.255.128.0 (= prefix /17) |

**Table 62:** Parameter definitions from the **show atmf tech** command (cont.)

| Parameter   | Definition  |
|-------------|---|
| Domain VLAN | The VLAN assigned for traffic between Nodes of same domain (crosslink).<br>VLAN ID - In this example VLAN 4091 is configured as the domain VLAN.<br>Domain Subnet - the Subnet address used for this traffic.<br>Domain IP Address - the IP address allocated for this traffic.<br>Domain Mask - the Netmask used to create a subnet for this traffic 255.255.128.0<br>(= prefix /17) |
| Device Type | Shows the Product Series Name.  |
| ATMF Master | Indicates the node's membership of the core domain (membership is indicated by Y)   |
| SC          | Shows switch configuration: <ul style="list-style-type: none"><li>• C - Chassis (such as SBx8100 series)</li><li>• S - Stackable (VCS)</li><li>• N - Standalone</li></ul>   |
| Parent      | A node that is connected to the present node's uplink, i.e. one layer higher in the hierarchy.  |
| Node Depth  | Shows the number of nodes in path from the current node to the Core domain.   |

**NOTE:** The **show atmf tech** command can produce very large output. For this reason only the most significant terms are defined in this table.

# show atmf virtual-links

**Overview** This command displays a summary of all virtual links (L2TP tunnels) currently in the running configuration.

**Syntax** `show atmf virtual-links [macaddr]`  
`show atmf virtual-links [id <1-4094>] [remote-id <1-4094>]`  
`show atmf virtual-links detail [id <1-4094>]`

| Parameter          | Description  |
|--------------------|--|
| macaddr            | Display the virtual AMF links' MAC addresses.  |
| id <1-4094>        | ID of the local virtual link.  |
| remote-id <1-4094> | ID of the remote virtual link  |
| detail             | Display information about a specific virtual link ID or range of virtual link IDs. Displays information such as: local and remote IP address, link type, packets received and transmitted. |

**Mode** Privileged Exec

**Example 1** To display AMF virtual links, use the command:

```
node_1# show atmf virtual-links
```

Table 60-1: Example output from **show atmf virtual-links**

```
ATMF Virtual-Link Information:
-----
Local      Local      Remote      Tunnel      Tunnel
Port      ID   IP          ID   IP          Protect     State
-----
vlink1    1     172.16.24.2  2     1.0.0.2     -           Complete
vlink2    2     172.16.24.2* 10    172.16.24.3* ipsec       Complete
vlink3    3     (eth0)*      1     1.2.3.4     -           AcquireLocal

* = Dynamic Address.

Virtual Links Configured: 3
```

In the above example, a centrally located switch has the IP address space 192.0.2.x/24. It has two VLANs assigned the subnets 192.0.2.33 and 192.0.2.65 using the prefix /27. Each subnet connects to a virtual link. The first link has the IP address 192.168.1.1 and has a Local ID of 1. The second has the IP address 192.168.2.1 and has the Local ID of 2.

**Example 2** To display details about AMF virtual link with ID 1, use the command:

```
node_1# show atmf virtual-links detail id 1
```

Table 60-2: Example output from **show atmf virtual-links**

```

Virtual Link Detailed Information:

ID 1      Description      : None
ID 1      Local IP Address  : 192.168.5.1
ID 1      Remote ID       : 1
ID 1      Remote IP Address  : 192.168.5.20
ID 1      Link Type       : virtual-link
ID 1      Packets Received  : 236465
ID 1      Packets Transmitted : 192626
    
```

**Example 3** To display AMF virtual links’ MAC address information, use the command:

```
node_1# show atmf virtual-links macaddr
```

Table 60-3: Example output from **show atmf virtual-links macaddr**

```

ATMF Link Remote Information:

ATMF Management Bridge Information:

Bridge: br-atmfmgmt

port no mac addr          is local?    ageing timer
  1    00:00:cd:27:c2:07    yes          0.00
  2    8e:c7:ae:81:7e:68    yes          0.00
  2    00:00:cd:28:bf:e7    no           0.01
    
```

Table 60-4: Parameters in the output from **show atmf virtual-links**

| Parameter      | Definition   |
|----------------|--|
| Local Port     | The tunnel name e.g. vlink1, vlink2, equivalent to an L2TP tunnel.   |
| Local ID       | The local ID of the virtual link. This matches the vlink<number>   |
| Tunnel Protect | Tunnel protection protocol.  |
| Tunnel State   | The operational state of the vlink (either Up or Down). This state is always displayed once a vlink has been created.                      |
| mac addr       | AMF virtual links terminate on an internal soft bridge. The “show atmf virtual-links macaddress” command displays MAC Address information. |
| is local?      | Indicates whether the MAC displayed is for a local or a remote device.   |
| ageing timer   | Indicates the current aging state for each MAC address.  |

**Related commands** [atmf virtual-link](#)

# show atmf working-set

**Overview** This command displays the nodes that form the current AMF working-set.

**Syntax** `show atmf working-set`

**Mode** Privileged Exec

**Example** To show current members of the working-set, use the command:

```
ATMF_NETWORK[6]# show atmf working-set
```

**Table 61:** Sample output from the **show atmf working-set** command.

```
ATMF Working Set Nodes:
node1, node2, node3, node4, node5, node6
Working set contains 6 nodes
```

[debug atmf packet](#)

# show running-config atmf

**Overview** This command displays the running system information that is specific to AMF.

**Syntax** `show running-config atmf`

**Mode** User Exec and Global Configuration

**Example** To display the current configuration of AMF, use the following commands:

```
node_1# show running-config atmf
```

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Related commands** `show running-config`  
`no debug all`

# state

**Overview** This command sets the running state of an AMF container on a Virtual AMF Appliance (VAA).

An AMF container is an isolated instance of AlliedWare Plus with its own network interfaces, configuration, and file system. The features available inside an AMF container are a sub-set of the features available on the host VAA. These features enable the AMF container to function as a uniquely identifiable AMF master and allows for multiple tenants (up to 60) to run on a single VAA host. See the [AMF Feature Overview and Configuration Guide](#) for more information on running multiple tenants on a single VAA host.

**Syntax** `state {enable|disable}`

| Parameter | Description  |
|-----------|--|
| disable   | Stop the AMF container. The container's state changes to stopped.  |
| enable    | Start the AMF container. The container's state changes to running. |

**Default** By default, **state** is disabled.

**Mode** AMF Container Configuration

**Usage notes** The first time the **state enable** command is executed on a container it assigns the container to an area and configures it as an AMF master. This is achieved by automatically adding the following configuration to the AMF container:

```
atmf network-name <AMF network-name>
atmf master
atmf area <container area-name> <container area-id> local
atmf area <container area-name> password <container area-password>
atmf area <host area-name> <host area-id>

interface eth0
  atmf-arealink remote-area <host area-name> vlan 4094
```

For this reason the **state enable** command should be run after the container has been created with the [atmf container](#) command and an area-link configured with the [area-link](#) command.

Once the start-up configuration has been saved from within the AMF container, all further configuration changes need to be made manually.

**Example** To start the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state enable
```

To stop the AMF container “vac-wlg-1” use the commands:

```
awplus# configure terminal
awplus(config)# atmf container vac-wlg-1
awplus(config-atmf-container)# state disable
```

**Related commands** [atmf container](#)  
[show atmf container](#)

**Command changes** Version 5.4.7-0.1: command added

# switchport atmf-agentlink

**Overview** Use this command to configure a link between this device and an x600 Series switch, in order to integrate the x600 Series switch into your AMF network. The x600 Series switch is called an “AMF agent”, and the link between the x600 and this device is called an “agent link”.

The x600 Series switch must be running version 5.4.2-3.16 or later.

Use the **no** variant of this command to remove the agent link. If the x600 Series switch is still connected to the switch port, it will no longer be part of the AMF network.

**Syntax** `switchport atmf-agentlink`  
`no switchport atmf-agentlink`

**Default** By default, no agent links exist and x600 Series switches are not visible to AMF networks.

**Mode** Interface mode for a switch port. Note that the link between the x600 and the AMF network must be a single link, not an aggregated link.

**Usage notes** The x600 Series switch provides the following information to the AMF node that it is connected to:

- The MAC address
- The IPv4 address
- The IPv6 address
- The name/type of the device (Allied Telesis x600)
- The name of the current firmware
- The version of the current firmware
- The configuration name

AMF guestnode also makes most of this information available from x600 Series switches, but requires configuration with DHCP and/or LLDP. AMF agent is simpler; as soon the x600 is connected to an appropriately configured port of an AMF node, it is immediately integrated into the AMF network.

To see information about the x600 Series switch, use the **show atmf links guest detail** command.

**Example** To configure port1.0.1 as an agent link, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# switchport atmf-agentlink
```

**Related commands** [show atmf links guest](#)

# switchport atmf-arealink

**Overview** This command enables you to configure a port or aggregator to be an AMF area link. AMF area links are designed to operate between two nodes in different areas in an AMF network.

Use the **no** variant of this command to remove any AMF area link that may exist for the selected port or aggregated link.

This command is only available on AMF controllers and master nodes.

**Syntax** `switchport atmf-arealink remote-area <area-name> vlan <2-4094>`  
`no switchport atmf-arealink`

| Parameter   | Description  |
|-------------|--|
| <area-name> | The name of the remote area that the port is connecting to.  |
| <2-4094>    | The VLAN ID for the link. This VLAN cannot be used for any other purpose, and the same VLAN ID must be used at each end of the link. |

**Default** No arealinks are configured.

**Mode** Interface Configuration for a switchport, a static aggregator, or a dynamic channel group.

**Usage notes** Run this command on the port or aggregator at both ends of the link.

Each area must have the area-name configured, and the same area password must exist on both ends of the link.

Running this command will automatically place the port or static aggregator into trunk mode (i.e. switchport mode trunk) and will synchronize the area information stored on the two nodes.

You can configure multiple arealinks between two area nodes, but only one arealink at any time will be in use. All other arealinks will block information, to prevent network storms.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**NOTE:** See the [atmf-arealink](#) command to configure an AMF area link on an AR-series Eth interface.

**Example** To make switchport port1.0.2 an arealink to the 'Auckland' area on VLAN 6, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.2
controller-1(config-if)# switchport atmf-arealink remote-area
Auckland vlan 6
```

To remove switchport port1.0.1 as an AMF area link, use the commands:

```
controller-1# configure terminal
controller-1(config)# interface port1.0.1
controller-1(config-if)# no switchport atmf-arealink
```

**Related commands**

- [atmf area](#)
- [atmf area password](#)
- [atmf virtual-link](#)
- [show atmf links](#)

# switchport atmf-crosslink

**Overview** This command configures the selected port, statically aggregated link or dynamic channel group (LACP) to be an AMF crosslink. Running this command will automatically place the port or aggregator into trunk mode (i.e. **switchport mode trunk**).

The connection between two AMF masters must utilize a crosslink. Crosslinks are used to carry the AMF control information between master nodes. Multiple crosslinks can be configured between two master nodes, but only one crosslink can be active at any particular time. All other crosslinks between masters will be placed in the blocking state, in order to prevent broadcast storms.

Note that AlliedWare Plus CentreCOM Series switches are AMF Edge nodes and do not support virtual links or crosslinks. This is because each edge node can only have a single physical AMF link.

Use the **no** variant of this command to remove any crosslink that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-crosslink`  
`no switchport atmf-crosslink`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Crosslinks can be used anywhere within an AMF network. They have the effect of separating the AMF network into separate domains.

Where this command is used, it is also good practice to use the **switchport trunk native vlan none** command with the parameter **none** selected. This is to prevent a network storm on a topology of ring connected devices.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**Example 1** To make switchport port1.0.1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2** This example is shown twice. Example 2A is the most basic command sequence. Example 2B is a good practice equivalent that avoids problems such as broadcast storms that can otherwise occur.

**Example 2A** To make static aggregator sa1 an AMF crosslink, use the following commands:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
```

**Example 2B** To make static aggregator sa1 an AMF crosslink, use the following commands for good practice:

```
Node_1# configure terminal
Node_1(config)# interface sa1
Node_1(config-if)# switchport atmf-crosslink
Node_1(config-if)# switchport trunk allowed vlan add 2
Node_1(config-if)# switchport trunk native vlan none
```

In this example VLAN 2 is assigned to the static aggregator, and the native VLAN (VLAN 1) is explicitly excluded from the aggregated ports and the crosslink assigned to it.

**NOTE:** *The AMF management and domain VLANs are automatically added to the aggregator and the crosslink.*

**Related commands** [show atmf links statistics](#)

# switchport atmf-guestlink

**Overview** Guest links are used to provide basic AMF functionality to non AMF capable devices. Guest links can be configured for either a selected switch port or a range of switch ports and use generic protocols to collect status and configuration information that the guest devices make available.

Use the **no** variant of this command to remove the guest node functionality from the selected port or ports.

**NOTE:** AMF guest nodes are not supported on ports using the OpenFlow protocol.

**Syntax** `switchport atmf-guestlink [class <guest-class>] [ip <A.B.C.D> | ipv6 <X:X::X:X>]`  
`no switchport atmf-guestlink`

| Parameter     | Description   |
|---------------|---|
| class         | Set a guest class   |
| <guest-class> | The name of the guest class.                                  |
| ip            | Specifies that the address following will have an IPv4 format |
| <A.B.C.D>     | The guest node's IP address in IPv4 format.                   |
| ipv6          | Specifies that the address following will have an IPv6 format |
| <X:X::X:X>    | The guest node's IP address in IPv6 format.                   |

**Default** No guest links are configured.

**Mode** Interface

**Example 1** To configure switchport port1.0.1 to be a guest link, that will connect to a guest node having a guest class of **camera** and an IPv4 address of **192.168.3.3**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class camera ip
192.168.3.3
```

**Example 2** To configure switchport port1.0.1 to be a guest link, which will connect to a guest node having a guest class of **phone** and an IPv6 address of **2001:db8:21e:10d::5**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink class phone ipv6
2000:db8:21e:10d::5
```

**Example 3** To configure switchport port1.0.1 to be a guest link, using the default model type and learning method address, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# switchport atmf-guestlink
```

**Example 4** To configure switchports port1.0.1 to port1.0.3 to be guest links, for the guest class **camera**, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1-port1.0.3
node1(config-if)# switchport atmf-guestlink class camera
```

**Example 5** To remove the guest-link functionality from switchport port1.0.1, use the following commands:

```
node1# configure terminal
node1(config)# int port1.0.1
node1(config-if)# no switchport atmf-guestlink
```

**Related commands**

# switchport atmf-link

**Overview** This command enables you to configure a port or aggregator to be an up/down AMF link. Running this command will automatically place the port or aggregator into trunk mode. If the port was previously configured in access mode, the configured access VLAN will be removed.

Use the **no** variant of this command to remove any AMF link that may exist for the selected port or aggregated link.

**Syntax** `switchport atmf-link`  
`no switchport atmf-link`

**Mode** Interface Configuration for a switchport, a static aggregator or a dynamic channel group.

**Usage notes** Up/down links and virtual links interconnect domains in a vertical hierarchy, with the highest domain being the core domain. In effect, they form a tree of interconnected AMF domains. This tree must be loop-free. Therefore you must configure your up/down and virtual links so that no loops are formed.

Within each domain, cross-links between AMF nodes define those nodes as siblings within the same domain. You can form rings by combining cross-links with up/down links and/or virtual links, as long as each AMF domain links upwards to only a single parent domain. Each domain may link downwards to multiple child domains.

For AMF links, we recommend not using VCStack ports that are configured as network ports. During AMF recovery, these ports revert to their default state of being VCStack ports, so AMF cannot use them for auto-recovery. We recommend using standard network ports instead of VCStack ports for AMF links, so you can take advantage of AMF recovery.

**NOTE:** See the [atmf-link](#) command to configure an AMF up/down link on an AR-series Eth interface.

**Example** To configure switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# switchport atmf-link
```

To remove switchport port1.0.1 as an AMF up/down link, use the commands:

```
Node_1# configure terminal
Node_1(config)# interface port1.0.1
Node_1(config-if)# no switchport atmf-link
```

**Related commands** [atmf-link](#)  
[show atmf detail](#)  
[show atmf links](#)

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** `type atmf guest {join|leave}`

| Parameter | Description            |
|-----------|------------------------|
| join      | AMF guest node joins.  |
| leave     | AMF guest node leaves. |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86  
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

# type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** type atmf node {join|leave}

| Parameter | Description      |
|-----------|------------------|
| join      | AMF node joins.  |
| leave     | AMF node leaves. |

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

### Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
001 Periodic (2 min)    Periodic Status Chk Y  N  Y Continuous    1  smtwtfS
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----

=====
Node2, Node3,
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----
```

### Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
=====
Node1:
=====

trigger 1
  type periodic 2
  script 1 atmf.scp
trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!
```

**Related commands** [show trigger](#)

# undebbug atmf

**Overview** This command is an alias for the **no** variant of the [debug atmf](#) command.

# username

**Overview** This command enables you to assign a **username** to a guest class. Guests may require a username and possibly also a password. In its non-encrypted form the password must be between 1 and 32 characters and will allow spaces. In its encrypted form the password must be between 1 to 64 characters and will allow any character

**Syntax** `username <name> password [8] <userpass>`  
`no username`

| Parameter  | Description   |
|------------|---|
| username   | Indicates that a user name is to follow.  |
| <name>     | User name of the guest node.  |
| password   | Indicates that a password (or specifier) is to follow.  |
| 8          | Specifier indicating that the following password is encrypted. It's primary purpose is to differentiate between the configuration input and the CLI input. You should not specify this for CLI input. |
| <userpass> | The password to be entered for the guest node.  |

**Default** No usernames configured

**Mode** AMF Guest Configuration

**Example** To assign the user name 'reception' and the password of 'secret' to an AMF guest node that has the guest class of 'phone1' use the following commands:

```
node1# configure terminal
node1(config)# amf guest-class phone1
node1(config-atmf-guest)# username reception password secret
```

To remove a guest node username and password for the user guest class 'phone1', use the following commands:

```
node1# configure terminal
node1(config)# atmf guest-class phone1
node1(config-atmf-guest)# no username
```

# 61

# Autonomous Wave Control Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure *Autonomous Wave Control (AWC)*.

AWC is an advanced network technology that utilizes game theory to deliver significant improvements in wireless network connectivity and performance. AWC can automatically minimize coverage gaps and reduce Access Point (AP) interference and respond to network configuration changes and bandwidth demands from user devices.

You can configure AWC through the command line, or through the Device GUI.

For more information, see the [Vista Manager mini User Guide](#).

# 3gpp-info (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the 3GPP (802.11u 3rd Generation Partnership Project) cellular network information.

Use the **no** variant of this command to revert to the default value.

**Syntax** `3gpp-info <code-list>`  
`no 3gpp-info`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;code-list&gt;</code> | <p>Enter the MCC (Mobile Country Code) and MNC (Mobile Network Code):</p> <ul style="list-style-type: none"><li>• MCC must be a 3 digit decimal number</li><li>• MNC must be a 2 or 3 digit decimal number</li><li>• MCC and MNC must be separated by commas</li><li>• If setting multiple combinations of MCC and MNC, they must be separated by semicolons.</li><li>• A maximum of 100 characters can be set including commas and semicolons.</li></ul> <p>For more information on mobile country and network codes, go to: <a href="#">Wikipedia Mobile Country Codes</a>.</p> |

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set some of the MCC and MNC codes for Japan, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# 3gpp-info
440,00;440,50
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# additional-step-required enable (wireless-network-passpoint-dot11u)

**Overview** Use this command to configure an Additional Step Required for Access.  
Use the **no** variant of this command to disable Additional Step Required for Access.

**Syntax** `additional-step-required enable`  
`no additional-step-required enable`

**Default** Disabled.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Usage notes** Typically, access and authentication is automatic if a legacy hotspot is operated by the mobile device's Home Service Provider (SP) or if the user has previously authenticated to that hotspot. Additionally, user intervention is typically required in a roaming environment where the hotspot is not operated by the Home SP and additional steps are required to identify and authenticate with the Home SP.

**Example** To enable Additional Step Required for Access, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
additional-step-required enable
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# airtime-fairness enable (wireless-ap-prof-radio)

**Overview** Use this command to enable **airtime-fairness** for all wireless clients regardless of speed.

Use the **no** variant of this command to disable airtime-fairness for all wireless clients.

**Syntax** `airtime-fairness enable`  
`no airtime-fairness enable`

**Default** Disabled.

**Mode** Wireless AP Profile Radio Configuration

**Usage notes** Airtime-fairness ensures that every client has equal access to air time, regardless of client capability. Client capability includes the wireless standard 802.11 mode and Radio Frequency (RF) link signal strength.

If two clients were each assigned a 10 Mbps bandwidth and sending equally sized frames then they potentially could have unequal air time if their RF link characteristics were different.

RF link characteristics are based upon the distance of the client from the Access Point (AP). A client that is closer to the AP typically operates at a higher data rate than a client farther from the AP. This is because the AP and client are deliberately designed to adapt their transmission rates in order to maintain an optimal quality of the RF link.

This behavior is normal between the AP and clients since the client devices are not expected to remain at a constant or equal distance from the AP. This could mean that one device is consuming more airtime than it is entitled to, even though that device is not consuming more than its bandwidth limit.

Note: This command is valid on TQ series devices only.

**Example** To enable airtime-fairness for 'radio 2' on 'ap-profile100' use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-prof 100
awplus(config-wireless-ap-prof)# ap-prof 100
awplus(config-wireless-ap-prof-radio)# radio 2
awplus(config-wireless-ap-prof-radio)# airtime-fairness enable
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# anqp-domain-id (wireless-network-passpoint-hs20)

**Overview** Use this command to set the ANQP (Access Network Query Protocol) domain identifier.

Use the **no** variant of this command to reset the ANQP domain identifier to the default value.

**Syntax** `anqp-domain-id <0-65535>`  
`no anqp-domain-id`

| Parameter                    | Description             |
|------------------------------|-------------------------|
| <code>&lt;0-65535&gt;</code> | ANQP domain identifier. |

**Default** 0

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set the ANQP domain identifier on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# anqp-domain-id
1
```

**Related commands** [show wireless network](#)  
[hs20 \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# anqp-element (wireless-network-passpoint-dot11u)

**Overview** Use this command to configure the Arbitrary Access Network Query Protocol (ANQP) element.

ANQP is a query and response protocol that defines services offered by an access point (AP), typically at a Wi-Fi hot spot.

Use the **no** variant of this command to remove a specified ANQP element entry.

**Syntax** `anqp-element info-id <0-999> payload HEX`  
`no anqp-element info-id <0-999>`

| Parameter | Description   |
|-----------|---|
| <0-999>   | Arbitrary ANQP element configuration's unique entry number.                           |
| HEX       | Arbitrary ANQP element configuration. The maximum number of characters in HEX is 100. |

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the ANQP element info ID to '1' and the payload HEX value to '0000', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# anqp-element
info-id 1 payload 0000
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# antenna (wireless-ap-prof-radio)

**Overview** Use the antenna command to set the antenna model for a wireless Access Point (AP).

Use the **no** variant of this command to remove the designated antenna model for a wireless AP.

**Syntax** antenna {an2458-10dp|an5158-16dp|an5158-19dp}  
no antenna

| Parameter   | Description               |
|-------------|---------------------------|
| an2458-10dp | Antenna model AN2458-10DP |
| an5158-16dp | Antenna model AN5158-16DP |
| an5158-19dp | Antenna model AN5158-19DP |

**Default** Not set.

**Mode** Wireless AP Profile Radio Configuration

**Example** To configure an AP radio configuration to use the antenna model AN5158-19DP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap)# hwtype tq single spec 11n
awplus(config-wireless-ap)# band 5
awplus(config-wireless-ap)# radio 1
awplus(config-wireless-ap-radio)# antenna an5158-19dp
```

**Related commands** [hwtype](#)  
[band](#)  
[radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added

# ap

**Overview** Use this command to configure an Access Point (AP).  
If the AP doesn't already exist, then this command creates it.  
Use the **no** variant of this command to remove an AP configuration.

**Syntax** `ap <1-65535>`

| Parameter                    | Description                 |
|------------------------------|-----------------------------|
| <code>&lt;1-65535&gt;</code> | AP configuration ID number. |

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** This command adds an AP configuration and enters the AP configuration mode.

**Example** To configure an AP with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
```

**Related commands**

- [login-password \(wireless-ap\)](#)
- [wds radio \(wireless-ap\)](#)
- [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# ap-profile (wireless)

**Overview** Use this command to configure an AP (Access Point) profile. If the AP profile doesn't already exist, then this command creates it.

Use the **no** variant of this command to delete an AP profile.

**Syntax** `ap-profile <1-65535>`  
`no ap-profile <1-65535>`

| Parameter                    | Description               |
|------------------------------|---------------------------|
| <code>&lt;1-65535&gt;</code> | The AP profile ID number. |

**Default** Not set.

**Mode** Wireless Configuration

**Example** To configure an AP profile with the ID profile number of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
```

To remove the AP profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no ap-profile 10
```

**Related commands** [show wireless ap-profile](#)  
[description \(wireless-ap-prof\)](#)  
[hwtype](#)  
[outdoor](#)  
[ntp designated-server](#)  
[led enable](#)  
[radio \(wireless-ap-profile\)](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.4.7-2.4: command added

# ap-profile (wireless-ap)

**Overview** Use this command to set an Access Point (AP) Profile to an AP.  
Use the **no** variant of this command to delete an AP Profile.

**Syntax** `ap-profile <1-65535>`  
`no ap-profile`

| Parameter                    | Description                         |
|------------------------------|-------------------------------------|
| <code>&lt;1-65535&gt;</code> | AP Profile configuration ID number. |

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To set AP Profile (ap-profile 100) to the AP 1 configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 1
awplus(config-wireless-ap)# ap-profile 100
```

**Related commands** [ap](#)  
[ap-profile \(wireless\)](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# association-advertisement enable

**Overview** Use this command to enable an Association Advertisement on the network configuration.

Use the **no** variant of this command to disable the Association Advertisement on the network configuration.

**Syntax** `association-advertisement enable`  
`no association-advertisement enable`

**Default** Disabled.

**Mode** Wireless Network Configuration

**Example** To enable the Association Advertisement for network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# association-advertisement
enable
```

**Related commands** [show wireless network](#)  
[network \(wireless\)](#)

**Command changes** Version 5.5.1-0.1: command added

# authentication (wireless-sec-wep)

**Overview** Use this command to enable or disable authentication on a wireless Access Point (AP).

**Syntax** authentication {both|open-system|shared-key}

| Parameter   | Description  |
|-------------|--|
| both        | Use both types of authentication: open-system and shared-key authentication. |
| open-system | No authentication.   |
| shared-key  | WEP authentication.  |

**Default** Open-system.

**Mode** Wireless Security WEP Configuration

**Usage notes** For **MWS** series devices, select either the open-system or shared-key parameter. You can't select the **both** parameter.

**Example** To configure WEP as the security authentication mode for clients, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# authentication shared-key
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# auto-discovery disable

**Overview** Use this command to disable the automatic search for new APs in an AWC Smart Connect (AWC-SC) network.

Use the **no** variant of this command to enable the automatic search for new APs.

**Syntax** auto-discovery disable  
no auto-discovery disable

**Default** Enabled

**Mode** Wireless Smart Connect Profile Configuration

**Usage notes** Auto-discovery is a function that allows an AP that is in the factory default state to automatically become part of an AWC-SC network. This is because when a wireless AP is activated in the factory default state, its IP and MAC address are added to the AP profile and the Smart Connect profile.

**Example** To turn auto-discovery off for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# auto-discovery disable
```

**Related commands** [smart-connect-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# band

**Overview** Use this command to assign a frequency band to a single antenna wireless AP. Use the **no** variant of this command to set the band to the default value of 2.

**Syntax** band {2|5}  
no band

| Parameter | Description |
|-----------|-------------|
| 2         | 2.4GHz band |
| 5         | 5GHz band   |

**Default** The default band is 2 (2.4GHz).

**Mode** Wireless AP Profile Configuration

**Usage notes** The command can only be used with single antenna APs.

**Example** To configure a 5GHz band for a single antenna AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# band 5
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)  
[antenna \(wireless-ap-prof-radio\)](#)

**Command changes** Version 5.4.7-2.4: command added

# band-steering (wireless-network)

**Overview** Use this command to enable band steering on a wireless Access Point (AP).  
Use the **no** variant of this command to disable band steering.

**Syntax** band-steering  
no band-steering

**Default** Disabled.

**Mode** Wireless Network Configuration

**Usage notes** Band Steering detects dual-band capable clients and steers them to the 5 GHz frequency. This leaves the more crowded 2.4 GHz band available for legacy clients.  
This helps improve end user experience by reducing channel utilization, especially in high density environments  
This command is not supported on the **MWS** series products.

**Example** To enable band steering, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# band-steering
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# bandwidth (wireless-ap-prof-radio)

**Overview** Use this command to assign a bandwidth to an Access Point (AP).  
Use the **no** variant of this command to revert to the default bandwidth.

**Syntax** `bandwidth {20|40|80}`  
`no bandwidth`

| Parameter | Description     |
|-----------|-----------------|
| 20        | 20MHz bandwidth |
| 40        | 40MHz bandwidth |
| 80        | 80MHz bandwidth |

**Default** The default bandwidth value varies according to the configured hardware and radio type.

**Mode** Wireless AP Profile Radio Configuration

**Example** To assign a 40MHz bandwidth to AP-profile 100 for Radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2

# bcast-key-refresh-interval (wireless-sec-osen)

**Overview** Use this command to set the refresh interval for the broadcast (group) key used with an OSEN security configuration.  
Use the **no** variant of this command to revert to the refresh interval default value.

**Syntax** `bcast-key-refresh-interval <0-86400>`  
`no bcast-key-refresh-interval`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;0-86400&gt;</code> | The key refresh interval in seconds. The range is 0 to 86400 seconds. |

**Default** Zero (0) is the default.

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint). OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

**Example** To set a broadcast key refresh interval of 3600 for a security configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# bcast-key-refresh-interval
3600
```

# bcast-key-refresh-interval (wireless-sec-wpa-ent)

**Overview** Use this command to set the refresh interval for the broadcast key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to set the refresh interval for the broadcast key to the default.

**Syntax** `bcast-key-refresh-interval <0-86400>`  
`no bcast-key-refresh-interval`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;0-86400&gt;</code> | The refresh interval in seconds<br>For the <b>MWS series</b> , the broadcast key refresh rate is <code>&lt;0, 30-3600&gt;</code> seconds. |

**Default** The default refresh interval is 0 seconds.

**Mode** Wireless Security WPA-enterprise Configuration

**Example** To set 3600 seconds as the broadcast key refresh interval, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)#
bcast-key-refresh-interval 3600
```

# bcast-key-refresh-interval (wireless-sec-wpa-psnl)

**Overview** Use this command to set the refresh interval for a broadcast (group) key used in a WPA-personal security configuration.

Use the **no** variant of this command to set the refresh interval to the default value.

**Syntax** `bcast-key-refresh-interval <0-86400>`  
`no bcast-key-refresh-interval`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;0-86400&gt;</code> | The broadcast key refresh interval.<br>For the <b>MWS series</b> , the broadcast key refresh rate is <code>&lt;0, 30-3600&gt;</code> seconds. |

**Default** The default value is 0.

**Mode** Wireless Security WPA-personal Configuration

**Example** To set the broadcast key refresh interval to 3600 seconds on a WPA-personal security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
bcast-key-refresh-interval 3600
```

# beacon-rssi-threshold (wireless-ap-prof-cb)

**Overview** Use this command to set the value of the beacon Received Signal Strength Indicator (RSSI) threshold for a wireless channel blanket configuration.  
Use the **no** variant of this command to reset the beacon RSSI to the default value.

**Syntax** `beacon-rssi-threshold <0-91>`  
`no beacon-rssi-threshold`

| Parameter                 | Description                                  |
|---------------------------|--|
| <code>&lt;0-91&gt;</code> | The RSSI threshold value on Channel Blanket. |

**Default** The default value is 0.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To configure a beacon RSSI threshold of 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# beacon-rssi-threshold 10
```

**Related commands** [channel-blanket](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.5.1-2.1: command added

# captive-portal

**Overview** Use this command to add a Captive Portal (web authentication) configuration and enter the Captive Portal configuration mode.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

This setting is only valid for AT-TQ series wireless access points.

Use the **no** variant of this command to remove a Captive Portal configuration.

**Syntax** `captive-portal`  
`no captive-portal`

**Default** Captive Portal is not set.

**Mode** Wireless Network Configuration

**Example** To enter the Captive Portal configuration mode of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
```

To reset all the Captive Portal configuration settings of network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no captive-portal
```

**Related commands**

**Command changes** Version 5.4.9-1.1: command added

# bss-trans-manage enable

**Overview** Use this command to enable Basic Service Set (BSS) Transition Management on a wireless network configuration. The BSS consists of one redistribution point — typically an access point (WAP or AP) interconnecting all associated wireless clients.

Use the **no** variant of this command to disable BSS Transition Management on a wireless network configuration.

**Syntax** `bss-trans-manage enable`  
`no bss-trans-manage enable`

**Default** Disabled.

**Mode** Wireless Network Configuration

**Example** To configure enable BSS Transition Management, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# bss-trans-manage enable
```

**Related commands** [show wireless network](#)  
[network \(wireless\)](#)

**Command changes** Version 5.5.0-2.3: command added

# captive-portal virtual-ip

**Overview** Use this command to configure the virtual IP address on Captive Portal.

Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access.

Use the **no** variant of this command to remove the virtual IP address on Captive Portal.

**Syntax** captive-portal virtual-ip <ip-address>  
no captive-portal virtual-ip

| Parameter    | Description                              |
|--------------|--|
| <ip-address> | The IPv4 address uses the format A.B.C.D |

**Default** Not set.

**Mode** Wireless AP Profile Configuration

**Usage notes** Captive Portal uses the AP's management IP address to show an authentication page. To avoid a potential security risk, this command allows you to hide the AP management IP address by providing a virtual IP address for Captive Portal authentication.

**Example** To configure a virtual IP address for Captive Portal, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 5
awplus(config-wireless-ap-prof)# captive-portal virtual-ip
1.1.1.1
```

**Command changes** Version 5.5.0-1.3: command added

# cb-channel

**Overview** Use this command to designate the fixed channel for channel blanket used by each of the radios in an AP profile.

Use the **no** variant of this command to revert to the default channel setting.

**Syntax** `cb-channel radio <1-3> channel <channel-number>`  
`no cb-channel radio <1-3>`

| Parameter        | Description   |
|------------------|---|
| <1-3>            | Select the radio interface number to be a fixed channel.                                      |
| <channel-number> | Fixed channel number. Select the channel from the eligible channels listed in the AP profile. |

**Default** Not set. When the parameter is blank, an eligible channel is configured automatically.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To configure cb-channel 10 to radio1 and cb-channel 40 to radio2 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof)# cb-channel radio 1 channel 10
awplus(config-wireless-ap-prof)# cb-channel radio 2 channel 40
```

**Related commands** [show wireless ap-profile](#)  
[channel-blanket](#)

**Command changes** Version 5.4.9-1.1: command added

# cb-proxy-arp enable

**Overview** Use this command to enable Proxy ARP on an AP profile channel blanket configuration.  
Use the **no** variant of this command to disable Proxy ARP on an AP profile channel blanket configuration.

**Syntax** `cb-proxy-arp enable`  
`no cb-proxy-arp enable`

**Default** Disabled.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To enable Proxy ARP for AP profile 1 channel blanket, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# cb-proxy-arp enable
```

**Command changes** Version 5.5.1-0.1: command added

# channels (wireless-ap-prof-radio)

**Overview** Use this command to set the channel that a wireless Access Point (AP) uses when it is set to auto.

Use the **no** variant of this command to return the AP channel to its default.

**Syntax** channels <1-255>  
no channels

| Parameter | Description         |
|-----------|---------------------|
| <1-255>   | The channel number. |

**Default** The default channel varies with each type of AP, its country-code, and outdoor settings.

**Mode** Wireless AP Profile Radio Configuration

**Example** To set the wireless AP radio channel, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# channels 10
```

**Related commands** [radio \(wireless-ap-profile\)](#)  
[hwtype](#)  
[outdoor](#)  
[country-code](#)

**Command changes** Version 5.4.7-2.4: command added.

# channel-blanket

**Overview** Use this command to enter the wireless-AP-profile-channel-blanket configuration mode. Once in this mode, you can modify the channel blanket configuration parameters for a wireless AP profile. A wireless AP profile defines the radio settings, such as band and channel selection and the control VLAN. The AP profile names the SSIDs to which it applies.

**NOTE:** *The channel-blanket setting can only be used with AT-TQ5403 and AT-TQ5403e APs. If this is set for other APs, you will not be able to manage those APs.*

Use the **no** variant of this command to reset all parameters for channel blanket to default.

**Syntax** channel-blanket  
no channel-blanket

**Default** Not set

**Mode** Wireless AP Profile Configuration

**Usage notes** When the command is entered, if the "key" parameter is empty, the automatically generated value is set.

**Example** To enter the channel blanket configuration mode for AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)#
```

To reset all the channel blanket parameters of AP profile 2, enter the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap profile 2
awplus(config-wireless-ap-prof)# no channel-blanket
```

**Related commands** [show wireless ap-profile](#)

**Command changes** Version 5.4.9-1.1: command added

# channel (wireless-ap-radio)

**Overview** Use this command to configure a channel on an Access Point (AP). You can configure an AP to automatically select a channel or use a fixed channel.

Use the **no** variant of this command to remove any configured channels and return to the default value.

**Syntax** `channel {auto|<1-255>}`  
`no channel`

| Parameter | Description   |
|-----------|---|
| auto      | The channel is automatically selected.                                |
| <1-255>   | A list of fixed channels. The list is determined by the country-code. |

**Default** The default is **auto**.

**Mode** Wireless AP Radio Configuration

**Example** To configure a fixed channel for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# channel 1
```

**Command changes** Version 5.4.7-2.4: command added.

# ciphers (wireless-sec-osen)

**Overview** Use this command to set which cipher suite to use with OSEN wireless security configuration.

Use the **no** variant of this command to revert to the default cipher suite.

**Syntax** `ciphers <cipher-list>`  
`no ciphers`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;cipher-list&gt;</code> | <p>Designate the cipher suite(s) in a list format. The cipher options are either <b>ccmp</b> or <b>tkip</b> or both in any order. The combinations you can select depend on the WPA version as follows:</p> <ul style="list-style-type: none"><li>• If the version is a combination of <b>wpa</b> and <b>wpa2</b>, the cipher suite can be either <b>ccmp</b> only or a combination of <b>ccmp</b> and <b>tkip</b>.</li><li>• If the version is only <b>wpa2</b>, the cipher suite can be selected from <b>ccmp</b> only or a combination of <b>ccmp</b> and <b>tkip</b>.</li><li>• If the version is only <b>wpa3</b>, only <b>ccmp</b> can be selected as the cipher suite.</li></ul> |

**Default** **ccmp**

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint). OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

**Example** To configure both ccmp (AES) and tkip as the cipher suite on a security configuration of OSEN, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# ciphers ccmp tkip
```

# ciphers (wireless-sec-wpa-ent)

**Overview** Use this command to set the cipher suite(s) used by WPA-personal security configurations. The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

**Syntax** `ciphers <cipher-list>`  
`no ciphers`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;cipher-list&gt;</code> | The available cipher suite(s) in list format. The list can contain either <b>ccmp</b> or <b>tkip</b> or both and can be in any order. |

**Default** CCMP.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** For **MWS** series devices, a combination of versions and ciphers are supported as follows:

- versions wpa2 and ciphers ccmp
- versions wpa, wpa2, and ciphers tkip and ccmp

**Example** To set both CCMP (AES) and TKIP as cipher suites on a security WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# ciphers ccma tkip
```

# ciphers (wireless-sec-wpa-psnl)

**Overview** Use this command to set the cipher suite(s) used by WPA-personal security configurations. The cipher suites available are: CCMP (AES) and TKIP.

Use the **no** variant of this command to set the default cipher suite used by WPA-personal security configurations.

**Syntax** `ciphers <cipher-list>`  
`no ciphers`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;cipher-list&gt;</code> | The available cipher suite(s) in list format. The list can contain either <b>ccmp</b> or <b>tkip</b> or both and can be in any order. |

**Default** `ccmp`.

**Mode** Wireless Security WPA-personal Configuration

**Usage notes** For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions `wpa2` and ciphers `ccmp`
- versions `wpa`, `wpa2`, and ciphers `tkip` and `ccmp`

**Example** To configure WPA-personal to use both CCMP (AES) and TKIP as cipher suites in a security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# ciphers ccmp tkip

# community read-only (wireless-ap-prof-snmp)

**Overview** Use this command to set an SNMP read-only community name for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to set the SNMP read-only community name back to the default (public).

**Syntax** `community read-only <community-name>`  
`no community read-only`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;community-name&gt;</code> | The community name to set. Valid characters are:<br>- alphanumeric characters<br>- symbols except for the following 6 symbols: " '\ & < > |

**Default** public

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP read-only community name to 'private', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# community read-only
private
```

To set the SNMP trap community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no community read-only

# conn-capability protocol (wireless-network-passpoint-hs20)

**Overview** Use this command to specify the protocols supported by the network connection and the corresponding port numbers and whether the port is open or closed.

Use the **no** variant of this command to remove the settings for the specified protocol number.

**Syntax** `conn-capability protocol <0-255> port <0-65535> status [closed|open|unknown]`  
`no conn-capability protocol <0-255>`

| Parameter | Description  |
|-----------|--|
| <0-255>   | Protocol number, as in the assigned protocol numbers listed at: <a href="http://www.iana.org">www.iana.org</a> . |
| <0-65535> | Port number  |
| closed    | Indicates the connection is in closed mode   |
| open      | Indicates the connection is in open mode   |
| unknown   | Indicates the connection status is unknown   |

**Default** Not set.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Usage notes** These settings signify the capabilities of the wired network that the AP is connected to. They provide information on the connection status of the most commonly used communication protocols and ports within the hotspot.

**Example** To set the connection capability on port 161 to 'closed' for protocol 17 (UDP), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
conn-capability protocol 17 port 161 status closed
```

# control-vlan

**Overview** Use this command to create a control VLAN ID for a wireless AP belonging to channel blanket.

Use the **no** variant of this command to clear an AP's designated channel blanket VLAN ID.

**Syntax** `control-vlan <vlan-id>`  
`no control-vlan`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;vlan-id&gt;</code> | The designated VLAN ID <1-4094> used on a wireless AP belonging to channel blanket. |

**Default** Not set

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To set the channel blanket control VLAN for AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# control-vlan 10
```

**Related commands** [ap-profile \(wireless-ap\)](#)

**Command changes** Version 5.4.9-1.1: command added

# country-code

**Overview** Use this command to set the country code for an AP-profile.

Use the **no** variant of this command to revert back to the default country code for the device's region.

**Syntax** `country code <code>`  
`no country code`

| Parameter                 | Description  |
|---------------------------|--|
| <code>&lt;code&gt;</code> | A two letter code representing the country. Use the command <code>show wireless country-code</code> to see the full list of country codes available. |

**Default** The default country code is '**jp**' for Japan or '**us**' for other regions.

**Mode** Wireless AP Profile Configuration

**Usage notes** To display a list of the country codes that can be applied, use the command **show wireless country-code**

Note, applying a new country code will reset the following configuration for the **ap-profile** and **ap-radio** modes:

- mode, bandwidth, and channel

**Example** To set the country code to 'New Zealand' for AP-profile 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# country-code nz
```

**Related commands**

- `show wireless country-code`
- `show wireless ap-profile`
- `channel (wireless-ap-radio)`
- `mode (wireless-ap-prof-radio)`
- `bandwidth (wireless-ap-prof-radio)`

# day (wireless-task)

**Overview** Use this command to set a day or range of days to run a task.

You can use the **time** command along with the **day** command to more fully set the task run time configuration.

Use the **no** variant of this command to remove the day set to run a task.

**Syntax** `day {<day> <month> <year>|<daysofweek>|every-day}`  
`no day`

| Parameter    | Description  |
|--------------|--|
| <day>        | The day set for the task. Select a number from 1-31.   |
| <month>      | The month to run the task. Enter the first three letters of the month, for example Jan, Feb, Mar...        |
| <year>       | The year to run the task. Select a year between <2000-2035>.   |
| <daysofweek> | The day or days of the week to run the task.<br>(sunday monday tuesday wednesday thursday friday saturday) |
| every-day    | Set the task to run on every day of the week.  |

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To configure task 5 to run on the 22nd of September 2017, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# day 22 Sep 2017
```

**Related commands** [task](#)

**Command changes** Version 5.4.7-2.4: command added.

# deauth-req-timeout (wireless-network-passpoint-hs20)

**Overview** Use this command to configure the deauthentication request timeout.  
Use the **no** variant of this command to revert the deauthentication timeout time to the default value.

**Syntax** `deauth-req-timeout <0-65535>`  
`no deauth-req-timeout`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;0-65535&gt;</code> | The timeout, in seconds, for client deauthentication after sending WNM notification frames. WNM notification requests allow the hotspot feature to send clients the URLs of servers that allow the client to access information about how to subscribe to the service, correct connection errors, or extend the current session. |

**Default** 60 seconds.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To configure a deauthentication request timeout of 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
deauth-req-timeout 120
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.0-2.3: command added

# debug wireless

**Overview** Use this command to enable wireless debugging. Debugging filters can be based on severity level and module name.

Use the **no** variant of this command to disable all wireless debugging.

**Syntax**

```
debug wireless level  
{all|debug|dump|error|info|notice|trace|warning}  
  
debug wireless module  
{all|apca|apmgr|apreq|clnmgr|cwmcore|rogue|syncscan}  
  
no debug wireless
```

| Parameter | Description  |
|-----------|--|
| level     | Filters logging events by severity level and displays the output by one of the following configured options: |
| all       | All level events   |
| debug     | Debug events   |
| dump      | Dump events  |
| error     | Error conditions   |
| info      | Information messages   |
| notice    | Normal, but significant conditions   |
| trace     | Trace events   |
| warning   | Warning conditions   |
| module    | Filters logging events by module name and displays the output by one of the following configured options:    |
| all       | All module events  |
| apca      | Auto power/channel assignment events   |
| apmgr     | AP manager events  |
| apreq     | HTTP AP request events   |
| clnmgr    | Client manager events  |
| cwmcore   | CWM core events  |
| rogue     | Rogue events   |
| syncscan  | Sync scan events   |

**Default** Disabled

**Mode** User Exec

**Example** To enable debugging of wireless with 'info' level on the 'apca' module, use the command:

```
awplus# debug wireless level info module apca
```

To disable debugging of wireless, use the command:

```
awplus# no debug wireless
```

**Related commands** [show debugging wireless](#)

**Command changes** Version 5.5.0-0.1: command added

# description (wireless-ap)

**Overview** Use this command to specify a description to identify an Access Point (AP).  
Use the **no** variant of this command to remove the description of a selected AP.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                     |
|----------------------------------|---------------------------------|
| <code>&lt;description&gt;</code> | Text to describe a specific AP. |

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To specify a description for an AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 10
awplus(config-wireless-ap)# description AP10_MEETING_SPACE
```

**Related commands** [ap](#)

# description (wireless-ap-prof)

**Overview** Use this command to configure an AP-profile description. You must be in the **config-wireless-ap-prof** mode to use this command.

Use the **no** variant of this command to remove an AP-profile description.

**Syntax** `description <description>`  
`no description`

**Default** Not set.

**Mode** Wireless AP Profile Configuration

**Example** To configure the description "PROF10" for an AP-profile, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# description PROF10
```

**Related commands** [ap-profile \(wireless\)](#)

# description (wireless-mac-flt)

**Overview** Use this command to set the description of a wireless MAC filter.  
Use the **no** variant of this command to remove the description.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                              |
|----------------------------------|--|
| <code>&lt;description&gt;</code> | Text describing the wireless MAC filter. |

**Default** No description set by default.

**Mode** Wireless MAC Filter Configuration

**Example** To set the description of MAC filter '20' to 'mywhitelist', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# description mywhitelist
```

To remove the description from MAC filter '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no description
```

# description (wireless-network)

**Overview** Use this command to set a description for the wireless network.  
Use the **no** variant of this command to remove a description for a wireless network.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                               |
|----------------------------------|---|
| <code>&lt;description&gt;</code> | Set a description for a wireless network. |

**Default** Not set.

**Mode** Wireless Network Configuration

**Example** To set the description for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# description GUEST_NETWORK
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# description (wireless-sc-prof)

**Overview** Use this command to configure a descriptive name for a Smart Connect profile. Use the **no** variant of this command to remove a Smart Connect profile name.

**Syntax** `description <sc-profile-name>`  
`no description`

| Parameter                            | Description  |
|--------------------------------------|--|
| <code>&lt;sc-profile-name&gt;</code> | The descriptive name given to a Smart Connect profile. |

**Default** Not set

**Mode** Wireless Smart Connect Profile Configuration

**Example** To set the descriptive name of SC-PROF10 for Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# description SC-PROF10
```

**Related commands** [smart-connect-profile](#)  
[show wireless ap-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# description (wireless-task)

**Overview** Use this command to set a description for a wireless task configuration. Use the **no** variant of this command to remove a description for a wireless task configuration.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;description&gt;</code> | The description for a wireless task configuration. |

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To set a description for the wireless task 5 configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# description PERIODIC_AWC_CALC
```

**Related commands** [task](#)  
[show wireless task](#)

**Command changes** Version 5.4.7-2.4: command added.

# description (wireless-trigger)

**Overview** Use this command to set a description for a wireless trigger.  
Use the **no** variant of this command to delete the description for a wireless trigger.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description                            |
|----------------------------------|--|
| <code>&lt;description&gt;</code> | Text to describe the wireless trigger. |

**Default** Not set.

**Mode** Wireless Trigger Configuration

**Example** To set a description on a wireless trigger, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-trigger 1
awplus(config-wireless-trigger)# description TRIGGER DESC 1
```

**Related commands** [wireless wireless-trigger](#)

**Command changes** Version 5.5.1-0.1: command added

# designated-ap

**Overview** Use this command to designate an AP to determine the BSSID (or name) of a channel blanket profile.

BSSIDs are used to describe sections of a wireless local area network. It recognizes the AP because it has a unique physical MAC address, which creates the wireless network.

This command configures the BSSID of the designated AP to be used as the BSSID of the channel blanket.

Use the **no** variant of this command to remove a designated AP.

**Syntax** `designated-ap <1-65535>`  
`no designated-ap`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-65535> | The ID of the designated AP. |

**Default** Not set.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Usage notes** If you do not designate an AP, the AP with the lowest ID is assigned automatically.

**Example** To designate AP 1001 on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# designated-ap 1001
```

**Related commands** [ap-profile \(wireless-ap\)](#)

# dgaf enable

## (wireless-network-passpoint-hs20)

**Overview** Use this command to enable Downstream Group-Addressed Forwarding (DGAF).  
Use the **no** variant of this command to disable DGAF.

**Syntax** dgaf enable  
no dgaf enable

**Default** Enabled.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To disable Downstream Group-Addressed Forwarding on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# no dgaf enable
```

**Related commands** [show wireless network](#)

[hs20 \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# domain-name (wireless-network-passpoint-dot11u)

**Overview** Use this command to configure one or more domain names for the entity operating the AP.

Use the **no** variant of this command to revert to the default value.

**Syntax** domain-name <domain-name>  
no domain-name

| Parameter     | Description  |
|---------------|--|
| <domain-name> | The Domain Name(s) <ul style="list-style-type: none"><li>• Use the FQDN format, e.g. domain-name example.com</li><li>• Multiple domain name entries must be separated by a comma</li><li>• The length of a character in the OI-List must be less than 255 , and 10 elements or less.</li></ul> |

**Default** Not set

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set two domain names, mydomain.com and example.net, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# domain-name
mydomain.com,example.net
```

**Command changes** Version 5.5.0-2.3: command added

# dot11u (wireless-network-passpoint)

**Overview** Use this command to add a new 802.11u configuration and enter the configuration mode.

Use the **no** variant of this command to revert to the default values.

**Syntax** dot11u  
no dot11u

**Default** Not set.

**Mode** Wireless Network Passpoint Configuration

**Example** To enter the 802.11u configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
```

**Command changes** Version 5.5.0-2.3: command added

# dtim-period

**Overview** Use this command to set the Delivery Traffic Indication Map (DTIM) period on the network configuration. A DTIM period value is a number that determines how often a beacon frame includes a Delivery Traffic Indication Message, and this number is included in each beacon frame.

Use the **no** variant of this command to reset the DTIM period to the default (1).

**Syntax** dtim-period <1-5>  
no dtim-period

| Parameter | Description   |
|-----------|---|
| <1-5>     | DTIM period in seconds. Increasing this number will increase the power saving effect, but it will slow down the response. |

**Default** 1.

**Mode** Wireless Network Configuration

**Usage notes** The DTIM is how the AP warns its clients that it is about to transmit the multicast (and broadcast) frames it queued up since the previous DTIM.

This queueing and scheduled delivery is done to allow power-conscious devices to save power by turning off their receivers for brief stretches of time, only waking up their receivers when the AP indicates it has traffic for them.

**Example** To set a DTIM period of 2 seconds on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# dtim-period 2
```

**Related commands** [show wireless network](#)  
[network \(wireless\)](#)

**Command changes** Version 5.5.1-0.1: command added

# dup-auth-received (wireless-network)

**Overview** Use this command to set a wireless network to accept or ignore 'Duplicate AUTH received' messages. If the message is accepted, then connected clients are disconnected.

Use the **no** variant of this command to use the default action.

**Syntax** dup-auth-received {disconnect|ignore}  
no dup-auth-received

| Parameter  | Description                               |
|------------|---|
| disconnect | Accept the disconnect connection request. |
| ignore     | Ignore the disconnection request.         |

**Default** Disconnect.

**Mode** Wireless Network Configuration

**Example** To configure network 5 to ignore 'Duplicate AUTH received' messages, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# dup-auth-received ignore
```

# dynamic-vlan enable (wireless-sec-osen)

**Overview** Use this command to enable the dynamic-vlan function on wireless APs using the OSEN security mode.

Use the **no** variant of this command to disable the dynamic-vlan function.

**Syntax** `dynamic-vlan enable`  
`no dynamic-vlan enable`

**Default** Enabled.

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

This command is not supported by MWS series APs.

**Example** To disable the dynamic-vlan function for security 100, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode osen
awplus(config-wireless-sec-osen)# no dynamic-vlan enable
```

# enable (wireless-ap-prof-snmp)

**Overview** Use this command to enable an SNMP configuration for the target AP profile. Use the **no** variant of this command to disable the SNMP configuration for the target AP profile.

**Syntax** enable  
no enable

**Default** Disabled

**Mode** Wireless AP Profile SNMP Configuration

**Example** To enable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# enable
```

To disable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no enable

# emergency-mode

**Overview** Use this command to set emergency mode on a wireless network. Wireless networks in emergency mode are only active when AWC is also in emergency mode. You can use emergency mode to prevent people from being isolated from infrastructure in the event of a natural disaster such as an earthquake or typhoon.

Use the **no** variant of this command to remove the emergency mode from a wireless network.

**Syntax** emergency-mode  
no emergency-mode

**Default** Disabled.

**Mode** Wireless Network Configuration

**Example** To configure an emergency mode for network 5, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# emergency-mode
```

**Related commands** [show wireless network](#)

# enable (wireless)

**Overview** Use this command to enable Access Point (AP) management by Autonomous Wave Control (AWC).

Use the **no** variant of this command to disable AP management by AWC.

**Syntax** enable  
no enable

**Default** Disabled.

**Mode** Wireless Configuration

**Usage notes** You must use the **enable** command before you configure a management address.

**Example** To configure AP management by AWC, using an interface with the IP address 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# enable
awplus(config-wireless)# management address 192.168.0.1

**Command changes** Version 5.4.7-2.4 command added.

# external-page-url

**Overview** Use this command to configure the external URL authentication page for Captive Portal.

To use this command, you must first specify external-page-redirect using the **mode** command.

Use the **no** variant of this command to reset the external authentication page URL.

**Syntax** external-page-url <URL>  
no external-page-url

| Parameter | Description                             |
|-----------|---|
| <URL>     | URL of the external authentication page |

**Default** Disabled

**Mode** Wireless Network Captive Portal Configuration

**Example** To enable and set URL string 'http://www.example.com' for a Captive Portal external web authentication server on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# external-page-url
http://www.example.com
```

**Command changes** Version 5.5.0-1.3: command added

# filter-entry

**Overview** Use this command to add a filter entry to a wireless MAC filter. You can optionally include a description for the filter.

Use the **no** variant of this command to remove an entry from the MAC filter list.

**Syntax** `filter-entry <mac-address> [description <description>]`  
`no filter-entry <mac-address>`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;mac-address&gt;</code> | MAC address of the filter entry in hexadecimal format HHHH.HHHH.HHHH.<br>The maximum number of MAC addresses that can be entered per MAC filter is 2048. |
| <code>description</code>         | Set an optional description for the filter entry.  |
| <code>&lt;description&gt;</code> | Text describing the filter entry.  |

**Default** No filter entries exist

**Mode** Wireless MAC Filter Configuration

**Example** To add a filter entry to MAC filter '20', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# filter-entry
0000.cd28.0880.1234 description PC01
```

To remove a filter entry from MAC filter '20', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)# no filter-entry
0000.cd28.0880.1234
```

# force-disable (wireless-ap-radio)

**Overview** Use this command to override and force the disabling of an Access Point (AP) radio status.

Use the **no** variant of this command to stop overrides of an AP radio status.

**Syntax** `force-disable`  
`no force-disable`

**Default** **no force-disable** (do not override the AP profile radio status).

**Mode** Wireless AP Radio Configuration

**Example** To force a disable of an AP radio status, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# force-disable
```

# gas-address-behavior (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the GAS (Generic Advertisement Services) Address 3 behavior for 802.11u.

Use the **no** variant of this command to revert to the default value.

**Syntax** `gas-address-behavior <0-2>`  
`no gas-address-behavior`

| Parameter | Description   |
|-----------|---|
| <0-2>     | <p>GAS Address 3 behavior.</p> <ul style="list-style-type: none"><li>• 0: P2P specification (Address3 = AP BSSID) workaround enabled by default based on GAS request Address3.</li><li>• 1: IEEE 802.11 standard compliant regardless of GAS request Address3</li><li>• 2: Force non-compliant behavior (Address3 = AP BSSID for all cases)</li></ul> |

**Default** 0.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the GAS Address 3 behavior value to 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#

# gas-comeback-delay (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the generic advertisement service (GAS) comeback-delay for 802.11u.

Use the **no** variant of this command to revert to the default value.

**Syntax** `gas-comeback-delay <0-65535>`  
`no gas-comeback-delay <0-65535>`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;0-65535&gt;</code> | GAS comeback delay Time Unit (TU)<br>1 TU = 1024 microseconds (approx 1 millisecond) |

**Default** 0.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the GAS comeback-delay value to 100, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
gas-comeback-delay 100
```

# hessid

## (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the HESSID (Homogeneous Extended Service Set Identifier).

Use the **no** variant of this command to revert to the default value.

**Syntax** hessid MAC  
no hessid

| Parameter | Description   |
|-----------|---|
| MAC       | Homogeneous ESS Identifier, in Hexidecimal notation and MAC address format: HHHH.HHHH.HHHH.HHHH |

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Usage notes** In typical Wi-Fi deployments, if two APs have different SSIDs, they are considered to be in different wireless networks.

If two APs have the same SSID, they are considered to be part of the same wireless network. But because SSIDs are not globally administered, it is possible that two APs with the same SSID are, in fact, in different wireless networks.

The homogeneous extended service set identifier (HESSID) element allows mobile devices to detect this condition. When two APs have the same SSID but from different wireless networks, the two networks have different HESSIDs

**Example** To set the Homogeneous ESS Identifier '02AA.BBCC.1122', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# hssid
02AA.BBCC.1122
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# hide-ssid (wireless-network)

**Overview** Use this command to hide the SSID for a selected wireless network.  
Use the **no** variant of this command to stop hiding the SSID for a selected wireless network.

**Syntax** `hide ssid`  
`no hide ssid`

**Default** The default is Disabled, which means the SSID **is** included in the Access Point (AP) beacon frames. For more information, see the **Usage** section below.

**Mode** Wireless Network Configuration

**Usage notes** The SSID differentiates one wireless network from another, so all APs and all devices attempting to connect to a specific wireless network must use the same SSID to enable effective roaming.

SSIDs are included in beacon frames.

A beacon frame is one of the management frames in the IEEE 802.11 standard. Every compliant AP periodically sends beacon frames to advertise the presence of an AP in an area, its capabilities, and some configuration and security information to the client devices.

**Example** To hide the SSID for network 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# hide-ssid
```

**Related commands** [ssid \(wireless-network\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# hs20 (wireless-network-passpoint)

**Overview** Use this command to add a new Hotspot 2.0 configuration and enter the configuration mode.

Use the **no** variant of this command to revert to the default.

**Syntax** hs20  
no hs20

**Default** Not set.

**Mode** Wireless Network Passpoint Configuration

**Example** To enter Hotspot 2.0 configuration mode on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20

**Command changes** Version 5.5.0-2.3: command added

# hwtype

**Overview** Use this command to configure the hardware type used for a wireless AP profile. Use the **no** variant of this command to revert the AP hardware type to the default.

**Syntax** `hwtype <modelname>`  
`hwtype tq {single|dual|triple} spec {11ac|11n}`  
`hwtype tq dual spec {11ac|11n}`  
`no hwtype`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;modelname&gt;</code> | Set the model name. See the table below for a list of model names and associated settings. |
| <code>tq</code>                | The hardware type used for the AT-TQ series  |
| <code>mws</code>               | The hardware type used for the AT-MWS series   |
| <code>single</code>            | Single antenna model. Only available for the AT-TQ series.                                 |
| <code>dual</code>              | Dual antenna model.  |
| <code>spec</code>              | Enable selection of support mode of the hardware type                                      |
| <code>11ac</code>              | Support for 802.11ac mode.   |
| <code>11n</code>               | Support for 802.11n mode.  |

**Table 1:** AP `modelname` parameters with applicable values

| modelname  | series           | bands supported     | standard supported |
|--|------------------|---------------------|--------------------|
| <code>at-tq5403</code><br><code>at-tqm5403</code><br><code>at-tq5403e</code>   | <code>tq</code>  | <code>triple</code> | <code>11ac</code>  |
| <code>at-tq4400</code><br><code>at-tq4400e</code><br><code>at-tq4600</code><br><code>at-tq1402</code><br><code>at-tqm1402</code> | <code>tq</code>  | <code>dual</code>   | <code>11ac</code>  |
| <code>at-tq2450</code><br><code>at-tq3400</code><br><code>at-tq3600</code>   | <code>tq</code>  | <code>dual</code>   | <code>11n</code>   |
| <code>at-tq3200</code>   | <code>tq</code>  | <code>single</code> | <code>11n</code>   |
| <code>at-mws1750ap</code><br><code>at-mws2533ap</code>   | <code>mws</code> | <code>dual</code>   | <code>11ac</code>  |
| <code>at-mws600ap</code>   | <code>mws</code> | <code>dual</code>   | <code>11n</code>   |

**Default** hwtype tq dual spec 11ac.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command may reset the following configuration commands for:

- antenna (AP profile)
- mode
- bandwidth
- channel

**Example** To configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype tq triple 11ac
```

To use the *<modelname>* parameter to configure the AP hardware type as an AT-TQ5403 (TQ series, triple antenna, supported by 802.11ac), use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# hwtype at-tq5403
```

**Related commands** ap-profile (wireless)

show wireless ap-profile

show wireless ap capability

**Command changes** Version 5.4.7-2.4: command added

Version 5.4.9-1.1: *<modelname>* parameter added.

# index

**Overview** Use this command to designate the key index number for WEP security.  
Use the **no** variant of this command to use the default key index number for WEP security.

**Syntax** `index <1-4>`  
`no index`

| Parameter | Description                                |
|-----------|--|
| <1-4>     | The index number for the WEP security key. |

**Default** The default key index number is set to **1**.

**Mode** Wireless Security WEP Configuration

**Example** To assign key index number 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# index 3
```

**Related commands** [security \(wireless\)](#)  
[key \(wireless-sec-wep\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# initialization-button enable

**Overview** Use this command to enable the initialization button on a wireless AP using the selected AP profile.

Use the **no** variant of this command to disable the initialization button on a wireless AP using the selected AP profile.

**Syntax** `initialization-button enable`  
`no initialization-button enable`

**Default** Enabled.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command effects only APs which have an initialization button.

**Example** To enable the initialization button on APs which use **ap-profile 100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# initialization-button enable
```

**Related commands** [ap-profile \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# internet-access enable (wireless-network-passpoint-dot11u)

**Overview** Use this command to enable Internet access. This informs the mobile device whether Internet access is available at a hotspot – which might not be the case in walled-garden environments, where the Hotspot Operator (for example, an hotel) may limit Wi-Fi access to locally available content.

Use the **no** variant of this command to disable Internet access.

**Syntax** `internet-access enable`  
`no internet-access enable`

**Default** Disabled.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure Internet access, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
internet-access enable
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# ip-addr-type-availability (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the IPv4 and IPv6 Address Type Availability for 802.11u.

This is information about the IP address version and type that the Hotspot Operator uses and that would be allocated and available to a mobile device after it authenticates to the network.

Use the **no** variant of this command to reset the IPv4 and IPv6 Address Type Availability to their default value.

**Syntax** ip-addr-type-availability  
{no-exist|public|port-restrict|private-nat1|private-nat2|port-private-nat1|port-private-nat2|unknown} ipv4  
{no-exist|exist|unknown}  
no ip-addr-type-availability

| Parameter                | Description  |
|--------------------------|--|
| no-exist (ipv4)          | Not exist IPv4.  |
| public (ipv4)            | Public IPv4.   |
| port-restrict (ipv4)     | IPv4 with port restrictions.   |
| private-nat1 (ipv4)      | Private IPv4 address with Network Address Translation (NAT) once.                |
| private-nat2 (ipv4)      | Private IPv4 address with Network Address Translation (NAT) twice.               |
| port-private-nat1 (ipv4) | Private IPv4 with port restrictions and Network Address Translation (NAT) once.  |
| port-private-nat2 (ipv4) | Private IPv4 with port restrictions and Network Address Translation (NAT) twice. |
| unknown (ipv4)           | Availability unknown IPv4  |
| no-exist (ipv6)          | Not exist IPv6   |
| exist (ipv6)             | Exist IPv6   |
| unknown (ipv6)           | Availability unknown IPv6  |

**Default** IPv4: port-private-nat1.

IPv6: no-exist

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the IPv4 Address Type Availability to public and the IPv6 to no-exist, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
ip-addr-type-availability public ipv6 no-exist
```

**Command changes** Version 5.5.0-2.3: command added

# ip-address (wireless-ap)

**Overview** Use this command to specify the IP address of a wireless Access Point (AP).  
Use the **no** variant of this command to remove the IP address of the selected wireless AP.

**Syntax** `ip-address <ip-address>`  
`no ip-address`

| Parameter                       | Description                      |
|---------------------------------|----------------------------------|
| <code>&lt;ip-address&gt;</code> | IPv4 address of the wireless AP. |

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To specify an IPv4 address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# ip address 192.168.0.100
```

**Related commands** [ap](#)

# key

**Overview** Use this command to designate the shared secret key used on a wireless AP belonging to channel blanket.

Use the **no** variant of this command to remove a designated key for a wireless AP belonging to channel blanket.

**Syntax** `key [encrypted] <key-string>`  
`no key`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>encrypted</code>          | This parameter is displayed in show running-config output to indicate that it is displaying the password in encrypted form. You should not enter encrypted on the CLI yourself. |
| <code>&lt;key-string&gt;</code> | The usable key-string characters. They can be up to 16 letters using ASCII Printable excluding double-quote and single-quote.   |

**Default** Not set.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Usage notes** When not set, a random shared key is automatically generated.

**Example** To configure AP profile 100, with a channel blanket key, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# key L51nJ6Cp/A-bwXx3
```

# key (wireless-sc-prof)

**Overview** Use this command to set the Smart Connect profile security key.  
Use the **no** variant of this command to remove the security key from the Smart Connect profile.

**Syntax** `key <key-word>`  
`no key`

| Parameter                     | Description  |
|-------------------------------|--|
| <code>&lt;key-word&gt;</code> | The WPA shared key. This is an alphanumeric string 8-64 characters long. |

**Default** Not set

**Mode** Wireless Smart Connect Profile Configuration

**Usage notes** This command configures the WPA shared key for the Smart Connect network. If no key is set, the security key will be automatically generated.

**Example** To set the security key for Smart Connect profile 10 to 'sc10-secret-keyword', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# key sc10-secret-keyword
```

**Related commands** [smart-connect-profile](#)

# key (wireless-sec-wep)

**Overview** Use this command to set the key-string for a WEP security configuration. Use the **no** variant of this command to remove a key-string for a WEP security configuration.

**Syntax** `key <1-4> [encrypted] <key-string>`  
`no key <1-4>`

| Parameter    | Description   |
|--------------|---|
| <1-4>        | The key's index number. To configure the index number(s), use the <b>index</b> command.   |
| encrypted    | This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>encrypted</b> on the CLI yourself.                 |
| <key-string> | The usable key-string characters, which depend on the key-string type. Use the <b>type</b> command to configure the key-string character type. See the table in the usage section below for more information. |

**Default** Not set.

**Mode** Wireless Security WEP Configuration

**Usage notes** When using the **key** command, also use the **type** command to set the key-string type to either ASCII or Hex, this will also set the character and bit number limits as follows.

| Type  | Number of bits | Number of characters | Case sensitive |
|-------|----------------|----------------------|----------------|
| ascii | 64             | 5                    | Yes            |
| ascii | 128            | 13                   | Yes            |
| hex   | 64             | 10                   | No             |
| hex   | 128            | 26                   | No             |

**Example** To assign the word 'friend' as the key-string at index 3 for a WEP security configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
awplus(config-wireless-sec-wep)# key 3 friend
```

**Command changes** Version 5.4.7-2.4: command added.

# key (wireless-sec-wpa-psnl)

**Overview** Use this command to set a string as the shared secret key on a wireless security WPA-personal configuration.

Use the **no** variant of this command to reset the shared key to the default.

**Syntax** `key [encrypted] <key-string>`  
`no key`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>encrypted</code>          | This parameter is displayed in <b>show running-config</b> output to indicate that it is displaying the password in encrypted form. You should not enter <b>encrypted</b> on the CLI yourself. |
| <code>&lt;key-string&gt;</code> | The usable key-string characters for the configuration. You can enter 8 to 63 ASCII characters which are case-sensitive.  |

**Default** Not set.

**Mode** Wireless Security WPA-personal Configuration

**Example** To set **friend** as the shared secret key for a WPA-personal configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# key friend
```

# l2tif enable (wireless-network-passpoint-hs20)

**Overview** Use this command to enable Layer 2 Traffic Inspection and Filtering (l2tif).  
Use the **no** variant of this command to disable Layer 2 Traffic Inspection and Filtering.

**Syntax** l2tif enable  
no l2tif enable

**Default** Disabled.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To enable Layer 2 Traffic Inspection and Filtering on network 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# l2tif enable
```

**Related commands** [show wireless network](#)

# led enable

**Overview** Use this command to turn on the LED of a wireless AP using the selected AP profile.

Use the **no** variant of this command to disable the LED of a wireless AP using the selected AP profile.

**Syntax** led enable  
no led enable

**Default** Enabled.

**Mode** Wireless AP Profile Configuration

**Example** To turn off the LED of a wireless AP using ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no led enable
```

**Related commands** [ap-profile \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# legacy-rates

**Overview** Use this command to set the legacy rates on the AP profile radio configuration. Use the **no** variant of this command to delete any configured fixed legacy rates and return to the default.

**Syntax** legacy-rates {all|<rates>}  
no legacy-rates

| Parameter | Description   |
|-----------|---|
| all       | All available rate candidates are set for the specified radio.  |
| <rates>   | Multiple usable rate candidates can be set on the specified radio, separated by commas.<br><b>For 2.4 GHz radios:</b> <ul style="list-style-type: none"><li>Select from: 54, 48, 36, 24, 18, 12, 11, 9, 6, 5.5, 2, 1.</li><li>If the bandwidth is 20MHz, one of 1, 2, 5.5, 11 must be specified.</li><li>If the bandwidth is 40MHz, then 1 must be specified</li></ul> <b>For 5 GHz radios:</b> <ul style="list-style-type: none"><li>Select from: 54, 48, 36, 24, 18, 12, 9, 6.</li></ul> Regardless of bandwidth, one of 6, 12, 24 must be specified. |

**Default** All.

**Mode** Wireless AP Profile Radio Configuration

**Example** To set specific legacy rates to an AP profile radio configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# legacy-rates
54, 48, 5.5, 2, 1
```

# length (wireless-sec-wep)

**Overview** Use this command to set the key length for a WEP key on a wireless security WEP configuration.

Use the **no** variant of this command to reset the key length for a WEP key to the default value.

**Syntax** length {64|128}  
no length

| Parameter | Description                                 |
|-----------|---|
| 64        | Set 64 bit as the key length for a WEP key  |
| 128       | Set 128 bit as the key length for a WEP key |

**Default** 128 bit.

**Mode** Wireless Security WEP Configuration

**Example** To configure 64 bit length as the key length for a WEP key on a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# length 64
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# log enable destination

**Overview** Use this command to enable the external media function storing of wireless client and neighbor AP log files.

Use the **no** variant of this command to disable the external media function storing of wireless client and neighbor AP log files.

**Syntax** `log enable destination {usb|card}`  
`no log enable`

| Parameter | Description            |
|-----------|------------------------|
| usb       | USB storage device     |
| card      | SD card storage device |

**Default** Disabled, there is no destination storage device set as a default.

**Mode** Wireless Configuration

**Example** To enable the log function and configure the log store destination to USB, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log enable destination usb
```

**Related commands** [log size wireless-client](#)  
[log rotate wireless-client](#)  
[log interval neighbor-ap](#)

**Command changes** Version 5.4.9-2.3: command added

# log interval neighbor-ap

**Overview** Use this command to configure the interval times for storing a neighbor AP log. Use the **no** variant of this command to revert to the default interval time of 30 minutes.

**Syntax** `log interval neighbor-ap <30-1440>`  
`no log interval`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;30-1440&gt;</code> | The interval time between storing neighbor AP logs. Enter a number in the range of 30 (min) -1440 (1 day). |

**Default** 30 minutes

**Mode** Wireless Configuration

**Example** To configure a 60 minute interval time for storing neighbor AP logs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log interval neighbor-ap 60
```

**Related commands** [log enable destination](#)  
[log rotate neighbor-ap](#)

**Command changes** Version 5.4.9-2.3: command added

# log rotate neighbor-ap

**Overview** Use this command to configure the number of rotations for storing neighbor AP log files. When the configured value is reached, the oldest log file is deleted and the latest log file is stored.

Use the **no** variant of this command to revert to the default value of 1.

**Syntax** `log rotate neighbor-ap <0-65534>`  
`no log rotate neighbor-ap`

| Parameter | Description  |
|-----------|--|
| <0-65534> | The number of rotations a neighbor AP log is stored for, before deleting the oldest stored file. |

**Default** 1

**Mode** Wireless Configuration

**Example** To configure 100 generations of a neighbor's AP log files to be stored, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate neighbor-ap 100
```

**Related commands** [log enable destination](#)

**Command changes** Version 5.4.9-2.3: command added

# log rotate wireless-client

**Overview** Use this command to configure the number of rotations for storing wireless client log files.

You can determine the size of each wireless client log by using this command and the **log size wireless-client** command together.

For example, log size wireless-client 50, log rotate wireless-client 4 ->  $50 / (4+1) = 10$ Kbytes.

Use the **no** variant of this command to revert to the default value of 1.

**Syntax** `log rotate wireless-client <0-255>`  
`no log rotate wireless-client`

| Parameter | Description   |
|-----------|---|
| <0-255>   | The number of rotations for a wireless-client log. Set a number in the range 0-255. |

**Default** The default number of rotations is 1.

**Mode** Wireless Configuration

**Example** To configure 10 generations of a wireless-client log file, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log rotate wireless-client 10
```

**Related commands** [log enable destination](#)  
[log size wireless-client](#)

**Command changes** Version 5.4.9-2.3: command added

# log size wireless-client

- Overview** Use this command to configure the file size used for storing wireless client logs. You can determine the size of each wireless client log by using this command and the **log rotate wireless-client** commands together.
- For example, log size wireless-client 50, log rotate wireless-client 4 ->  $50 / (4+1) = 10$ Kbytes.
- Use the **no** variant of this command to revert to the default log size value.

**Syntax** log size wireless-client <50-4194304>  
no log size wireless-client

| Parameter    | Description                           |
|--------------|---------------------------------------|
| <50-4194304> | Wireless client log size in kilobytes |

**Default** 50 kilobytes.

**Mode** Wireless Configuration

**Example** To configure a wireless-client log size of 1Mbyte, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# log size wireless-client 1000000
```

**Related commands** [log enable destination](#)

**Command changes** Version 5.4.9-2.3: command added

# login username (wireless-ap)

**Overview** Use this command to specify a username and password for a wireless Access Point (AP).

Use the **no** variant of this command to remove a username and password for a wireless AP.

**Syntax** login username <username> password <password>  
no login username

| Parameter  | Description  |
|------------|--|
| <username> | The username for the selected AP. The first character of the AP username must be a letter. |
| <password> | An alphanumeric string of characters used as the password for the selected AP.             |

**Default** Not set

**Mode** Wireless AP Configuration

**Example** To set the username **manager** and password **friend** for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login username manager password friend
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# login-password (wireless-ap)

**Overview** Use this command to set the login password for an Access Point (AP).  
Use the **no** variant of this command to remove the login password for an AP.

**Syntax** login-password <password>  
no login-password

| Parameter  | Description  |
|------------|--|
| <password> | An alphanumeric string of characters used as the password for the selected AP. |

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To configure a password for AP 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# login-password friend
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# mac-address (wireless-ap)

**Overview** Use this command to specify the MAC address for a wireless Access Point (AP).  
Use the **no** variant of this command to remove the MAC address of the selected wireless AP.

**Syntax** `mac-address <mac-address>`  
`no mac-address`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;mac-address&gt;</code> | The MAC address of the wireless AP in hexadecimal notation with the format HHHH.HHHH.HHHH. |

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To specify a MAC address for a wireless AP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# mac-address 0000.5e00.5301
```

**Related commands** [ap](#)  
[show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# mac-auth password

**Overview** Use this command to change the password for MAC-based authentication. Use the **no** variant of this command to return the password to its default.

**Syntax** `mac-auth password <password>`  
`no mac-auth password`

| Parameter                     | Description  |
|-------------------------------|--|
| <code>&lt;password&gt;</code> | The new password. Passwords can be up to 64 characters in length and can contain any printable characters except ?, " (double quotes), and spaces. |

**Default** By default the password is the MAC address of the supplicant.

**Mode** Wireless Network Configuration

**Example** To set the password for MAC authentication to be 'SECRET', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth password SECRET
```

To reset the password for MAC authentication to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth password
```

**Related commands**

- [enable \(wireless-network-cp\)](#)
- [network \(wireless\)](#)
- [mac-auth radius auth group \(wireless-network\)](#)
- [mac-auth username](#)

**Command changes** Version 5.4.9-2.1: command added

# mac-auth radius auth group (wireless-network)

**Overview** Use this command to enable MAC authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable MAC authentication with a RADIUS group.

**Syntax** `mac-auth radius auth group {radius|<group-name>}`  
`no mac-auth radius auth group`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>radius</code>             | Use a RADIUS group, which means <b>all</b> RADIUS servers. |
| <code>&lt;group-name&gt;</code> | The RADIUS server group.                                   |

**Default** Not set.

**Mode** Wireless Network.

**Usage notes** This command enables MAC authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

**Example** To enable MAC authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# mac-auth radius auth group
radius
```

**Related commands** [network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# mac-auth username

**Overview** Use this command to set the format of the MAC address in the username and password field when a request for MAC-based authorization is sent to a RADIUS server.

Use the **no** variant of this command to reset the format to the default of hyphen and lower-case.

**Syntax** `mac-auth username {hyphen|colon|unformatted}  
{lower-case|upper-case}`  
`no mac-auth username`

| Parameter   | Description  |
|-------------|--|
| hyphen      | The MAC address includes hyphens, e.g. xx-xx-xx-xx-xx-xx.              |
| colon       | The MAC address includes colons, e.g. xx:xx:xx:xx:xx:xx.               |
| unformatted | The MAC address does not include hyphens or colons, e.g. xxxxxxxxxxxx. |
| lower-case  | The MAC address uses lower-case characters (a-f).                      |
| upper-case  | The MAC address uses upper-case characters (A-F).                      |

**Default** Default format is hyphen lower-case.

**Mode** Wireless Network Configuration

**Example** To configure the format of the MAC address in the username and password field to be colon and upper-case, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# mac-auth username colon
upper-case
```

To reset the format of the MAC address in the username and password field to the default, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no mac-auth username
```

**Related commands** [enable \(wireless-network-cp\)](#)  
[mac-auth password](#)  
[mac-auth radius auth group \(wireless-network\)](#)

network (wireless)

**Command changes** Version 5.4.9-2.1: command added

# management address

**Overview** Use this command to configure a management address on the router for transmitting Autonomous Wave Control (AWC) packets to Access Points (APs). The management address must already exist on a device interface.

Use the **no** variant of this command to turn off AP management by AWC on the management address.

**Syntax** `managment address <ipv4-addr>`  
`no management address`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;ipv4-addr&gt;</code> | Set the IPv4 interface address used for AP management by AWC.    |
| <code>no</code>                | Unset the IPv4 management address used for AP management by AWC. |

**Default** Not enabled.

**Mode** Wireless Configuration

**Example** To configure an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# management address 192.168.0.1
```

To remove an AP management interface address, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no management address
```

**Related commands** [enable \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# management-frame-protection enable (wireless-sec-osen)

**Overview** Use this command to enable management frame protection (MFP) for wireless Access Points (APs) using the OSEN security mode.

MFP provides security for management messages passed between APs and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

**Syntax** `management-frame-protection enable [type {capable|required}]`  
`no management-frame-protection enable`

| Parameter             | Description   |
|-----------------------|---|
| <code>type</code>     | The type of protection, select <b>capable</b> or <b>required</b> . If protection <b>type</b> is omitted, then <b>capable</b> is the default protection type.  |
| <code>capable</code>  | Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features. |
| <code>required</code> | Prevents clients that do not support 802.11w from associating with the SSID.  |

**Default** Enabled.

**Mode** Wireless Security OSEN Configuration

**Usage notes** Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

**Example** To enable management frame protection for clients that do not support 802.11w, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode osen
awplus(config-wireless-sec-osen)# management-frame-protection
enable type required
```

To disable management frame protection, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode osen
awplus(config-wireless-sec-osen)# no
management-frame-protection enable
```

Version 5.5.0-2.3: command added

# management-frame-protection enable (wireless-sec-wpa-ent)

**Overview** Use this command to enable management frame protection (MFP) in a WPA-enterprise configuration.

MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

Use the **no** variant of this command to disable MFP.

**Syntax** `management-frame-protection enable [type{capable|required}]`  
`no management-frame-protection enable`

| Parameter             | Description   |
|-----------------------|---|
| <code>type</code>     | The type of protection, select <b>capable</b> or <b>required</b> . If protection <b>type</b> is omitted, then <b>capable</b> is the default protection type.  |
| <code>capable</code>  | Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features. |
| <code>required</code> | Prevents clients that do not support 802.11w from associating with the SSID.  |

**Default** Enabled.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

**Example** To **disable** MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-enterprise
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

# management-frame-protection enable (wireless-sec-wpa-psnl)

**Overview** Use this command to enable Management Frame Protection (MFP). MFP provides security for management messages passed between wireless Access Points (APs) and client stations. MFP checks management messages for potential security issues such as rogue devices and denial-of-service attacks.

This parameter will be ignored when the version list includes **wpa3** as WPA3 requires that MFP is enabled, see [versions \(wireless-sec-wpa-psnl\)](#).

Use the **no** variant of this command to disable MFP.

**Syntax** `management-frame-protection enable [type {capable | required}]`  
`no management-frame-protection enable`

| Parameter | Description   |
|-----------|---|
| type      | The type of protection, select <b>capable</b> or <b>required</b> . If protection <b>type</b> is omitted, then <b>capable</b> is the default protection type.  |
| capable   | Mixed operation. Allows legacy devices that do not support 802.11w to associate while also allowing devices that support 802.11w to use the 802.11w features. |
| required  | Prevents clients that do not support 802.11w from associating with the SSID.  |

**Default** Enabled.

**Mode** Wireless Security WPA-personal Configuration

**Usage notes** Select the protection **type** based on the WPA version:

If the WPA version is:

- a combination of **wpa** and **wpa2**, then protection is disabled
- only **wpa2**, then the protection type can be either **capable**, **required**, or **disabled**
- only **wpa3**, then the protection type is **required**

**Example** To disable MFP, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# no
management-frame-protection enable
```

# max-clients

**Overview** Use this command to set the number of clients able to connect to a wireless Access Point (AP).

Use the **no** variant of this command to return the number of clients able to connect to the default value.

**Syntax** `max-clients <0-200>`  
`no max-clients`

| Parameter                  | Description   |
|----------------------------|---|
| <code>&lt;0-200&gt;</code> | The number of clients able to connect to the wireless AP. Configuring the <b>number 0</b> will disable all clients from connecting to the selected AP. For the <b>MWS</b> series, the range is: <code>&lt;0-127&gt;</code> with a default of 127. |

**Default** 200.

**Mode** Wireless AP Profile Radio Configuration

**Example** To set the maximum number of clients that can connect to a wireless AP to 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# max-clients 100
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# mode (wireless-ap-prof-radio)

**Overview** Use this command to set the **wireless standard** and **bandwidth** mode used by the Access Points (APs) in a secure wireless security configuration. The AP type or model determines which mode to select.

Use the **no** variant of this command to set the mode to the default values specified for an AP type.

**Syntax** mode {a|bg|a-n|bg-n|n-only-a|n-only-g|a-n-ac|n-ac}  
no mode

| Parameter | Standard     | Description  |
|-----------|--------------|--|
| a         | 802.11a      | Bandwidth 54Mbps - 5GHz  |
| bg        | 802.11bg     | Bandwidths 11 and 54Mbps- 2.4GHz.  |
| a-n       | 802.11a/n    | Bandwidths 54 and 300 Mbps - 2.4GHz.   |
| bg-n      | 802.11b/g/n  | Bandwidths 11, 54, and 300 Mbps - 2.4GHz   |
| n-only-a  | 802.11n      | Bandwidth 300 Mbps using the 5GHz bandwidth  |
| n-only-g  | 802.11n      | Bandwidth 300 Mbps using the 2.4GHz bandwidth  |
| a-n-ac    | 802.11a/n/ac | Dual-band: supporting simultaneous connections on both the 2.4 GHz and 5 GHz Wi-Fi bands. 802.11ac offers backward compatibility to 802.11 b/g/n and bandwidth rated up to 1300 Mbps on the 5 GHz band plus up to 450 Mbps on 2.4 GHz. |
| n-ac      | 802.11n/ac   | Dual-band: Bandwidth 54, and 300Mbps using both the 2.4 and 5GHz frequencies.  |

**Default** The default values change with each antenna type and AP.

**Mode** Wireless AP Profile Radio Configuration

**Example** To configure the wireless mode **a-n-ac** for AP profile 100, radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# mode a-n-ac
```

**Related commands** [country-code](#)

**Command changes** Version 5.4.7-2.4: command added.

# mode (wireless-network-cp)

**Overview** Use this command to set the Captive Portal (web authentication) mode. Captive Portal lets wireless clients authenticate themselves or agree to terms and conditions before you grant them Wi-Fi access or external web access. Use the **no** variant of this command to reset the Captive Portal mode to default.

**Syntax** mode {click-through|radius|external-page-redirect}  
no mode

| Parameter              | Description   |
|------------------------|---|
| radius                 | The user name and password entered from the browser screen are sent to the RADIUS server and a network connection is permitted after successful authentication. |
| click-through          | This method asks users to agree to the terms of use (click-through agreement) before allowing them to connect to the wireless network.                          |
| external-page-redirect | Redirect the authentication page to a user configured URL such as a third party Captive Portal vendor page.   |

**Default** click-through

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** Click-through is only valid for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 wireless access points.

Click-through is not supported on TQ2450, TQ3200, TQ3400 or TQ3600 APs. Set the mode to **radius** (external RADIUS authentication) for these devices.

**Example** To set the Captive Portal authentication mode as RADIUS, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
```

Version 5.5.0-1.3: **external-page-redirect** parameter added

# nai-realm

## (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the NAI (Network Access Identifier) Realm information. Use the **no** variant of this command to remove a specified NAI Realm entry.

**Syntax** `nai-realm <realm-number> realm-name <realm-name> eap-method <eap-method>`  
`no nai-realm <realm-number>`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;realm-number&gt;</code> | NAI Realm information's unique entry number in the range <1-10>   |
| <code>&lt;realm-name&gt;</code>   | NAI Realm name: <ul style="list-style-type: none"><li>• The NAI Realm Name in FQDN (Fully Qualified Domain Name) format.</li><li>• Multiple NAI Realm Names must be separated by a comma.</li><li>• The maximum number of characters allowed including commas is 100.</li></ul> |
| <code>&lt;eap-method&gt;</code>   | Designated EAP method(s) in a list format. The list can use either <b>eap-tls</b> or <b>eap-ttls</b> or <b>eap-sim</b> or two of these three in any order.  |

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Usage notes** A network access identifier (NAI) is a standardized (RFC 4282) format for identifying users requesting access to a network (e.g.user@realm.com). Thus, an NAI Realm identifies the proper authentication server or domain for the user's authentication exchange.

**Example** To configure an NAI Realm Name and EAP method(s), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# nai-realm 2
realm-name example.com eap-method eap-tls eap-ttls
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.0-2.3: command added

# neighbor-ap-detection enable

**Overview** Use this command to enable Neighbor AP Detection on the AP profile radio configuration.

Use the **no** variant of this command to disable Neighbor AP Detection for an AP profile radio configuration.

**Syntax** neighbor-ap-detection enable  
no neighbor-ap-detection enable

**Default** Enable.

**Mode** Wireless AP Profile Radio Configuration

**Example** To disable Neighbor AP Detection for APs using AP profile 1, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)# no
neighbor-ap-detection enable
```

**Command changes** Version 5.5.1-0.1: command added

# neighbor-managed-ap-detection enable

**Overview** Use this command to enable Neighbor AP Detection for all managed APs on the wireless network.

Use the **no** variant of this command to disable Neighbor AP Detection for all managed APs on the wireless network.

**Syntax** neighbor-managed-ap-detection enable  
no neighbor-managed-ap-detection enable

**Default** Enabled.

**Mode** Wireless Configuration

**Example** To disable Neighbor AP Detection for all managed APs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no neighbor-managed-ap-detection
enable
```

**Related commands** [show wireless](#)  
[wireless](#)

**Command changes** Version 5.5.1-0.1: command added

# network-auth-type (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the network authentication type.

Use the **no** variant of this command to remove the specified network authentication type.

**Syntax** `network-auth-type`  
{online-enrollment|terms-and-conditions|redirect-http-https|  
redirect-dns} [redirect-url <url>]

`no network-auth-type`  
{online-enrollment|terms-and-conditions|redirect-http-https|  
redirect-dns}

| Parameter            | Description   |
|----------------------|---|
| online-enrollment    | Authentication type as online enrollment.   |
| terms-and-conditions | Authentication type as terms and conditions.  |
| redirect-http-https  | Redirect using HTTP/HTTPS.  |
| redirect-dns         | Redirect using DNS.   |
| redirect url <url>   | Redirect using URL.<br>The URL is an ASCII string of up to 128 characters other than the following characters:<br>{, },  , \, ^, [, ], `<br>Refer to RFC-2396 |

**Default** Not set.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set the network authentication type as online-enrollment with a redirect URL, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
network-auth-type online-enrollment redirect-url example.com
```

To delete the network authentication type online-enrollment, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# no
network-auth-type online-enrollment
```

# network-type (wireless-network-passpoint-dot11u)

**Overview** Use this command to select the access network type.

Use the **no** variant of this command to revert to the default access network type.

**Syntax** `network-type {private|guest-private|chargeable-public|free-public|personal-device|emergency|test|wildcard}`  
`no network-type`

| Parameter         | Description                       |
|-------------------|-----------------------------------|
| private           | Private network                   |
| guest-private     | Private network with guest access |
| chargeable-public | Chargeable public network         |
| free-public       | Free public network               |
| personal-device   | Personal device network           |
| emergency         | Emergency service only network    |
| test              | Test or experimental network      |
| wildcard          | Wildcard                          |

**Default** Private.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To enter the 802.11u configuration mode and set the network access type to free-public, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# network-type
free-public
```

**Command changes** Version 5.5.0-2.3: command added

# network (wireless)

**Overview** Use this command to configure an Autonomous Wave Control (AWC) network. If the network doesn't exist, then this command creates it. Use the **no** variant of this command to remove an AWC network.

**Syntax** `network <1-65535>`

| Parameter | Description           |
|-----------|-----------------------|
| <1-65535> | The network ID number |

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** This commands adds a network configuration and enters the network configuration mode.

**Example** To configure an AWC network with an ID of 20, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
```

**Related commands**

**Command changes** Version 5.4.7-2.4: command added.

# ntp designated-server

**Overview** Use this command to designate the NTP server that a wireless Access point (AP) refers to.

Use the **no** variant of this command to remove the configured IP address or host-name of the NTP server.

**Syntax** `ntp designated-server {ip <ip-address>|host <host-name>}`  
`no ntp designated-server`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | Specify the IP address of the NTP server, entered in the form A.B.C.D for an IPv4 address. |
| <code>&lt;host-name&gt;</code>  | Specify the host-name for the NTP server   |

**Default** Disabled.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command sets the NTP server that a wireless AP refers to. If the NTP server is disabled, then the AP will synchronize its time with the AWC router.

This is because the AP can not hold current time after a reboot because it does not have a real-time clock.

Therefore, the NTP master must be configured on the AWC router.

**Example** To configure an NTP server with an IP address of 192.168.0.254 for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
192.168.0.154
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)  
[ntp designated-server period](#)

**Command changes** Version 5.4.7-2.4: command added

# ntp designated-server enable

**Overview** Use this command to configure NTP on a wireless Access Point (AP).  
Use the **no** variant of this command to disable the NTP feature on an AP.

**Syntax** ntp designated-server enable  
no ntp designated-server enable

**Default** Enabled.

**Mode** Wireless AP Profile Configuration

**Example** To disable NTP for AP-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# no ntp designated-server
enable
```

**Related commands** [ntp designated-server](#)

**Command changes** Version 5.4.7-2.4: command added.

# ntp designated-server period

**Overview** Use this command to set the time adjustment period for an NTP server. This is the time adjustment period for a wireless AP using the selected AP profile.

Use the **no** variant of this command to reset the time adjustment period to the default of 10 minutes.

**Syntax** `ntp designated-server period <1-9999>`  
`no ntp designated-server period`

| Parameter | Description   |
|-----------|---|
| <1-9999>  | The time adjustment period for the NTP server in minutes. |

**Default** 10 minutes.

**Mode** Wireless AP Profile Configuration

**Example** To configure 30 minutes as the NTP server time adjustment period for ap-profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# ntp designated-server
192.168.0.254
awplus(config-wireless-ap-prof)# ntp designated-server period
30
```

**Related commands** [ap-profile \(wireless\)](#)  
[show wireless ap-profile](#)  
[ntp designated-server](#)

**Command changes** Version 5.4.7-2.4: command added.

# operating-class (wireless-network-passpoint-hs20)

**Overview** Use this command to set the Operating Class for Hotspot 2.0.  
Use the **no** variant of this command to revert to the default value.

**Syntax** `operating-class <HEX-value>`  
`no operating-class`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;HEX-value&gt;</code> | Operating Class Indication value in HEX.<br>Refer to Table E-4 of IEEE Std 802.11-2012 Annex E |

**Default** 51

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set an Operating Class Indication value of 51, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)#
operating-class 51
```

**Related commands** [show wireless network](#)  
[hs20 \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# operator (wireless-network-passpoint-hs20)

**Overview** Use this command to configure the operator friendly name, unique entry number, and language code of a Hotspot 2.0 entry.

Use the **no** variant of this command to remove the configuration details of a Hotspot 2.0 entry.

**Syntax** `operator <operator-id> lang <language-code> friendly-name  
<friendly-name>`  
`no operator <operator-id>`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;operator-id&gt;</code>   | The unique operator entry number. Select from the range 1-10.   |
| <code>&lt;language-code&gt;</code> | The language code. You can use only 2 or 3 characters as specified in ISO-639. For example: English is 'eng', Japanese is 'jpn'.                                    |
| <code>&lt;friendly-name&gt;</code> | The text field used to identify the Hotspot venue operator. You can use up to 252 octets of special characters (utf-8 encode). For example: "Allied Bld.5th floor". |

**Default** Not set

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To configure the language code and operator friendly name on Operator ID 2, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# operator 2
lang eng friendly-name Allied-Telesis
```

**Related commands** [show wireless network](#)  
[hs20 \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# outdoor

**Overview** Use this command to designate that a wireless AP is located outdoors.

Use the **no** variant of this command to designate when a wireless AP is not located outdoors.

**Syntax** outdoor  
no outdoor

**Default** No outdoor.

**Mode** Wireless AP Profile Configuration

**Usage notes** This command indicates whether the wireless AP is located outdoors, and selects the mode and channel that corresponds to this. To configure a channel number, use the **channel** command in **wireless-ap-prof-radio** mode. If you configure an invalid channel number, an error message displays the valid channels that you may select in your region.

The command is ignored when the AP is already configured using the **hwtype** command.

**Example** To configure an AP to be located outdoors, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# outdoor
```

**Command changes** Version 5.4.7-2.4: command added

# page-proxy-url

**Overview** Use this command in Captive Portal mode to set the location of the custom page to display for web authentication. This page will be displayed instead of the wireless access point's built-in authentication or click-through page.

Use the **no** variant of this command to remove the URL pointing to the custom web authentication page.

**Syntax** `page-proxy-url <URL>`  
`no page-proxy-url`

| Parameter | Description  |
|-----------|--|
| <URL>     | URL of external web server (hostname or dotted IP notation). |

**Default** No custom page is set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is valid only for AT-TQ5403, AT-TQm5403, AT-TQ5403e, AT-TQ1402, and AT-TQm1402 wireless access points.

**Example** To enable and set the web authentication proxy page, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# page-proxy-url

**Command changes** Version 5.5.0-2.3: command added

# peer (wireless-wds)

**Overview** Use this command to add a pair of wireless Access Points (APs) to a WDS peer list. Use the **no** variant of this command to remove a pair of wireless APs from a WDS peer list.

**Syntax** peer ap <1-65535> radio <1-3> {ap <1-65535>|mac <mac-addr>}  
radio <1-3>  
no peer

| Parameter  | Description   |
|------------|---|
| ap         | Signifies that the first AP identifier follows.   |
| <1-65535>  | The first AP identifier.  |
| radio      | Select the radio interface of the first AP.   |
| <1-3>      | Designate the radio interface for the first AP.   |
| ap         | Signifies that the second AP identifier follows.  |
| <1-65535>  | The second AP identifier.   |
| mac        | Signifies that the MAC address of the second AP follows.  |
| <mac-addr> | The MAC address of the second AP.<br>Enter the address in the format <HHHH.HHHH.HHHH> where <i>H</i> is a hexadecimal number. |
| radio      | Select the radio interface of the second AP.  |
| <1-3>      | The radio interface for the second AP.  |

**Default** There are no APs configured in a WDS peer list by default.

**Mode** Wireless WDS Configuration

**Example** To add a pair of wireless APs to a WDS peer list, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# peer ap 10 radio 1 ap 20 radio 1
```

**Related commands** wds  
show wireless wds

**Command changes** Version 5.4.7-2.4: command added.

# permit host (wireless-ap-prof-snmp)

**Overview** Use this command to set the SNMP permit host for the target AP profile. This command is valid for SNMP v1 and v2c only.

Use the **no** variant of this command to remove the SNMP permit host from the AP profile.

**Syntax** permit host <host-name>  
no permit host

| Parameter   | Description   |
|-------------|---|
| <host-name> | Respond only to SNMP requests from the specified host name. For example FQDN, IP address, or subnet mask (manager.your.domain.com, 10.10.1.37, 192.168.1.1/24). |

**Default** Not set

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP permit host to '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# permit host 192.168.1.1
```

To remove the SNMP permit host '192.168.1.1', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no permit host
```

# port (wireless-ap-prof-snmp)

**Overview** Use this command to set the SNMP listening port number for the target AP profile. Use the **no** variant of this command to set the SNMP listening port back to the default (161).

**Syntax** `port <1-65535>`  
`no port`

| Parameter                    | Description                            |
|------------------------------|--|
| <code>&lt;1-65535&gt;</code> | The SNMP listening port number to set. |

**Default** 161

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP listening port to 166, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# port 166
```

To set the SNMP listening port back to the default (161), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no port
```

**Command changes** Version 5.5.0-2.1: command added

# power (wireless-ap-radio)

**Overview** Use this command to set the power level for client devices on a wireless Access Point (AP).  
Use the **no** variant of this command to return the power level to its default value.

**Syntax** `power <1-100>`  
`no power`

| Parameter                  | Description                       |
|----------------------------|-----------------------------------|
| <code>&lt;1-100&gt;</code> | The percentage power level value. |

**Default** A power level of 100% is the default.

**Mode** Wireless AP Radio Configuration

**Example** To set a power level of 30% for radio 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# power 30
```

**Related commands** [show wireless ap](#)  
[radio \(wireless-ap\)](#)

**Command changes** Version 5.4.7-2.4: command added

# pre-authentication enable (wireless-sec-osen)

**Overview** Use this command to allow wireless Access Points (APs) that have WPA2 clients to share the pre-authentication packets from the WPA2 clients with other APs.

When enabled, this speeds up authentication for roaming clients who connect to multiple APs.

Use the **no** variant of this command to disable pre-authentication

**Syntax** `pre-authentication enable`  
`no pre-authentication enable`

**Default** Enabled.

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

This command is not supported by WPA clients.

**Example** To disable pre-authentication for an OSEN security configuration, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# no pre-authentication enable
```

**Related commands** [security \(wireless\)](#)  
[show wireless security](#)

**Command changes** Version 5.5.0-2.3: command added

# pre-authentication enable (wireless-sec-wpa-ent)

**Overview** Use this command to enable WPA-enterprise pre-authentication for Access Points (APs) that have WPA2 clients.

Use the **no** variant of this command to disable WPA-enterprise pre-authentication.

**Syntax** `pre-authentication enable`  
`no pre-authentication enable`

**Default** Enabled.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** Enable this option if the AP has WPA2 clients and you want the AP to share the pre-authentication packets from the clients with other access points. If it is enabled, this can speed up authentication for roaming clients who connect to multiple access points. This option does not apply to WPA clients.

The MWS series of devices do not support pre-authentication, therefore, you should **disable** this command on these devices.

**Example** To disable pre-authentication on a WPA-enterprise configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# no pre-authentication
enable
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# proxy-arp enable

**Overview** Use this command to enable proxy ARP on the wireless network. When Downstream Group-Addressed Forwarding (DGAF) is disabled, AlliedWare Plus enables Proxy ARP on the Access Points.

Use the **no** variant of this command to disable proxy ARP.

**Syntax** proxy-arp enable  
no proxy-arp enable

**Default** Disabled.

**Mode** Wireless Network Configuration

**Example** To enable Proxy ARP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# proxy-arp enable
```

**Related commands** [show wireless network](#)

# qos-map-set (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the QoS map set for 802.11u.  
Use the **no** variant of this command to revert to the default value.

**Syntax** `qos-map-set <qos-map>`  
`no qos-map-set`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;qos-map&gt;</code> | <p>QoS map configuration.</p> <ul style="list-style-type: none"><li>The QoS map is a comma delimited list of decimal values in the range 0-63 or 255.</li><li>The maximum number of elements in the list is 29. (21(DSCP Exception) + 8(User Priority). Refer to: IEEE Std 802.11-2012, 8.4.2.97.</li><li>Total length of QOSMAP &lt; 190.</li></ul> <p>Format:<br/>[&lt;DSCP Exceptions[DSCP,UP]&gt;,&lt;UP 0 range[low,high]&gt;,...&lt;UP 7 range[low,high]&gt;</p> |

**Default** 0

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure the qos map set, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# qos-map-set
53,2,22,6,8,15,0,7,255,16,31,32,39,255,255,40,47,255,255
```

**Command changes** Version 5.5.0-2.3: command added

# radio (wireless-ap)

**Overview** Use this command to enter **wireless-ap-radio** configuration mode.

**Syntax** radio <1-3>

| Parameter | Description          |
|-----------|----------------------|
| <1-3>     | The radio interface. |

**Mode** Wireless AP Configuration

**Example** To enter the AP Radio configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)#
```

**Command changes** Version 5.4.7-2.4: command added

# radio (wireless-ap-profile)

**Overview** Use this command to enter AP profile radio configuration mode. Once in this mode, you can create and modify the radio configuration parameters for an AP profile.

**Syntax** radio <1-3>

| Parameter | Description                                |
|-----------|--|
| <1-3>     | The radio interface within the AP profile. |

**Mode** Wireless AP Profile Configuration

**Example** To enter the AP profile radio configuration mode for interface 1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# radio 1
awplus(config-wireless-ap-prof-radio)#
```

**Related commands**

**Command changes** Version 5.4.7-2.4: command added.

# radius accounting enable

**Overview** Use this command to configure RADIUS accounting on Captive Portal with external RADIUS.

Use the **no** variant of this command to disable RADIUS accounting on Captive Portal.

**Syntax** radius accounting enable  
no radius accounting enable

**Default** Disabled.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** The server settings used by Captive Portal RADIUS accounting are those configured by the **radius auth group** command. The port number used is the same one set on the primary server by the command **radius-server host**.

**Example** To configure RADIUS accounting on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# radius accounting enable
```

**Related commands** captive-portal virtual-ip  
radius accounting enable  
radius auth group (wireless-network-cp)

**Command changes** Version 5.5.0-1.3: command added

# radius auth group (wireless-network-cp)

**Overview** Use this command to set the RADIUS server/s that wireless APs use for Captive Portal (web authentication).

Use the **no** variant of this command to remove the RADIUS server/s used for authentication.

**Syntax** `radius auth group {radius|<groupname>}`  
`no radius auth group {radius|<groupname>}`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>radius</code>            | Use a RADIUS server registered with the <a href="#">radius-server host</a> command.  |
| <code>&lt;groupname&gt;</code> | Use a RADIUS server that belongs to the specified server group. Use a server group created with the <a href="#">aaa group server radius</a> command. |

**Default** No RADIUS server set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is only valid for TQ series APs. It has no effect on MWS series APs.

**Example** To use the RADIUS group 'my\_rad' for Captive Portal authentication, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# mode radius
awplus(config-wireless-network-cp)# radius auth group my_rad
```

**Related commands**

**Command changes** Version 5.4.9-1.1: command added

# radius authentication group (wireless-sec-osen)

**Overview** Use this command to assign a RADIUS server group for authenticating wireless AP clients using the OSEN security mode.

Use the **no** variant of this command to revert to the default RADIUS server group.

**Syntax** `radius auth group {radius|<group-name>}`  
`no radius auth group`

| Parameter                       | Description                 |
|---------------------------------|-----------------------------|
| <code>radius</code>             | Use RADIUS servers.         |
| <code>&lt;group-name&gt;</code> | Use the RADIUS server group |

**Default** RADIUS.

**Mode** Wireless Security OSEN Configuration

**Usage notes** The RADIUS server group is configured with the **aaa group server** command. The group name **radius** is predefined, which includes all RADIUS servers configured by the **radius-server host** command. However, this command, (**radius authentication group**) uses only the first two configured servers.

**Example** To configure the RADIUS authentication group to authenticate APs using the OSEN security mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# radius authentication group
radius
```

**Related commands** [radius-server host](#)

[security \(wireless\)](#)

**Command changes** Version 5.5.0-2.3: command added

# radius auth group (wireless-sec-wpa-ent)

**Overview** Use this command to set the RADIUS server group used to authenticate clients in a wireless WPA-enterprise.

Use the **no** variant of this command to set the RADIUS server group to the default.

**Syntax** `radius auth group {radius|<group-name>}`  
`no radius auth group`

| Parameter                       | Description             |
|---------------------------------|-------------------------|
| <code>radius</code>             | Use all RADIUS servers. |
| <code>&lt;group-name&gt;</code> | Server group name       |

**Default** RADIUS (all RADIUS servers).

**Mode** Wireless Security WPA-enterprise Configuration

**Example** To set **radius**, which means all RADIUS servers, to authenticate a wireless WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# radius auth group radius
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added

# redirect-url

**Overview** Use this command to enable the redirect-url feature. After successful authentication this feature redirects the web browser to the URL specified in the command. If both [session-keep](#) and **redirect-url** are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the redirect-url feature.

**Syntax** `redirect-url <URL>`  
`no redirect-url`

| Parameter | Description   |
|-----------|---|
| <URL>     | URL of page to redirect the user to (hostname or dotted IP notation). |

**Default** Not set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

**Example** To enable and set the redirect-url for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# redirect-url
http://www.mydomain.com/welcome
```

# rogue-ap-detection enable (wireless)

**Overview** Use this command to enable rogue application detection.  
Use the **no** variant of this command to disable rogue application detection.

**Syntax** `rogue-ap-detection enable`  
`no rogue-ap-detection enable`

**Default** Disabled.

**Mode** Wireless Configuration

**Example** To enable rogue application detection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# rogue-ap-detection enable
```

**Related commands** [show wireless](#)

**Command changes** Version 5.4.7-2.4 command added.

# roaming-oi

## (wireless-network-passpoint-dot11u)

**Overview** Use this command to set the Roaming Consortium List. A Roaming Consortium List contains multiple Organisation Identifiers (OIs) whose security credentials can be used to connect to a network.

Use the **no** variant of this command to revert to the default value.

**Syntax** `roaming-oi <oi-list>`  
`no roaming-oi`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;oi-list&gt;</code> | Roaming Consortium List. <ul style="list-style-type: none"><li>You can have multiple OIs in a list</li><li>Each OI is between 3 and 15 octets and is configured as a hexadecimal string.</li><li>Separate OIs with a comma.</li><li>The maximum number of OIs is 15.</li><li>The length of a character in the OI-List must be less than 465 including commas.</li></ul> |

**Default** None

**Mode** Wireless Network Passpoint 802.11u Configuration

**Usage notes** The Roaming Consortium Element tell a mobile device which roaming consortiums or service providers are available through an AP.

**Example** To set a Roaming Consortium List containing two OIs, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# roaming-oi
021122,2233445566
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.0-2.1: command added.

# sc-profile

**Overview** Use this command to add a Smart Connect profile configuration and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to remove a Smart Connect profile configuration.

**Syntax** `sc-profile <1-65535>`  
`no sc-profile`

| Parameter                    | Description                   |
|------------------------------|-------------------------------|
| <code>&lt;1-65535&gt;</code> | The Smart Connect profile ID. |

**Default** Not set

**Mode** Wireless AP Profile Configuration

**Example** To add Smart Connect profile 1 to AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 10
awplus(config-wireless-ap-prof)# sc-profile 1
```

**Related commands** [smart-connect-profile](#)

**Command changes** Version 5.5.0-0.1: command added

# sc-channel

**Overview** Use this command to set a fixed radio channel for an access point (AP) using Smart Connect.

Use the **no** variant of this command to delete this setting.

**Syntax** `sc-channel radio <1-3> channel {<channel-number>|auto}`  
`no sc-channel`

| Parameter        | Description  |
|------------------|--|
| <1-3>            | Select the radio channel fixed for AWC-SC use              |
| <channel-number> | Select the radio channel that is defined in the AP profile |
| auto             | The radio channel is automatically selected                |

**Default** Not set.

**Mode** Wireless Smart Connect Profile Configuration

**Example** To automatically configure the Smart Connect channel with AP profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)# sc-channel radio 2 channel
auto
```

# security (wireless)

**Overview** Use this command to configure a wireless security instance and enter a configuration mode. If the instance doesn't already exist, then this command creates it. The command has four different types of configuration mode: OSEN, WEP, WPA-Personal, and WPA-Enterprise.

Use the **no** variant of this command to remove a wireless security instance.

**Syntax** `security <1-65535> mode {osen|wep|wpa-personal|wpa-enterprise}`  
`no security <1-65535>`

| Parameter      | Description   |
|----------------|---|
| <1-65535>      | Wireless security instance identification number  |
| mode           | Security mode   |
| osen           | Security mode OSEN. This assigns the configuration identifier to <b>config-wireless-sec-osen</b> mode and enters the mode.              |
| wep            | Security mode WEP. This assigns the configuration identifier to <b>config-wireless-sec-wep</b> mode and enters the mode.                |
| wpa-personal   | Security mode WPA-Personal. This assigns the configuration identifier to <b>config-wireless-sec-wpa-psnl</b> mode and enters the mode.  |
| wpa-enterprise | Security mode WPA-Enterprise. This assigns the configuration identifier to <b>config-wireless-sec-wpa-ent</b> mode and enters the mode. |

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** You create a wireless security instance by designating a security instance ID and selecting a security mode. There are four types of security modes:

- OSEN
- WEP
- WPA-Personal
- WPA-Enterprise

**Example** To configure and enter the wireless security mode for WPA-Personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 10 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)#
```

Version 5.5.0-2.3: **osen** parameter added

# security (wireless-network)

**Overview** Use this command to designate a security configuration identifier for a wireless security configuration.  
Use the **no** variant of this command to remove a security configuration identifier.

**Syntax** `security <1-65535>`  
`no security`

| Parameter                    | Description                                     |
|------------------------------|---|
| <code>&lt;1-65535&gt;</code> | The wireless security configuration identifier. |

**Default** Not set.

**Mode** Wireless Network Configuration

**Example** To assign a security configuration identifier of 10 to wireless network 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 2
awplus(config-wireless-network)# security 10
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# security (wireless-wds)

**Overview** Use this command to set a wireless security configuration identifier to the WDS configuration mode.

Use the **no** variant of this command to remove the WDS security configuration identifier.

**Syntax** `security <1-65535>`  
`no security`

| Parameter | Description                                     |
|-----------|---|
| <1-65535> | The wireless security configuration identifier. |

**Default** Not set.

**Mode** Wireless WDS Configuration

**Example** To designate the wireless security configuration identifier to the WDS configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
awplus(config-wireless-wds)# security 2
```

**Related commands** [wds](#)  
[show wireless wds](#)

**Command changes** Version 5.4.7-2.4: command added

# service wireless

**Overview** Use this command to enable wireless services.  
Use the **no** version of the command to disable unused wireless services.

**Syntax** `service wireless`  
`no service wireless`

**Default** Enabled

**Mode** Global Configuration

**Usage notes** On devices that support the wireless manage feature, sometimes it may be desirable to disable unused services, in order to reduce memory use. Disabling the wireless services will only take effect after you save the configuration and restart the device.

**Example** To disable the wireless service, use the commands:

```
awplus# configure terminal
awplus(config)# no service wireless
```

**Output** Figure 61-1: Example output from **no service wireless**

```
awplus(config)#no service wireless
% Save the config and restart the device for this change to take
effect
```

**Command changes** Version 5.5.0-0.1: command added

# session-keep

**Overview** Use this command to enable the session-keep feature. After successful authentication this feature redirects the web browser back to the originally requested URL. If both **session-keep** and **redirect-url** are enabled, session-keep takes precedence.

Use the **no** variant of this command to disable the session-keep feature.

**Syntax** `session-keep`  
`no session-keep`

**Default** Not set by default.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This setting is valid only for TQ4400, TQ4600, TQ4400e, TQ1402, TQ5403, TQ5403e, TQm1402, and TQm5403 APs. It has no effect on TQ2450, TQ3200, TQ3400, TQ3600 and MWS series APs.

**Example** To configure session-keep for Captive Portal authentication on network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-keep
```

# session-key-refresh-action

**Overview** Use this command to set the action after the interval has expired for the session key used in a WPA-enterprise security configuration.

Use the **no** variant of this command to revert to the default action.

**Syntax** `session-key-refresh-action {reauthentication|disconnection}`  
`no session-key-refresh-action`

| Parameter                     | Description  |
|-------------------------------|--|
| <code>reauthentication</code> | The client will be asked to re-authenticate after the session expires. |
| <code>disconnection</code>    | The client will be disconnected when the session expires.              |

**Default** Reauthentication.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** This command will not work if the **session-key-refresh-interval** command is set to a non-zero value.

**Example** For a WPA-enterprise configuration, to set disconnect as the action after the expire session-key refresh interval, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 100 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)#
session-key-refresh-action disconnection
```

**Related commands** [show wireless security](#)  
[session-key-refresh-interval](#)

**Command changes** Version 5.5.1-2.1: command added

# session-key-refresh-interval

**Overview** Use this command to set the refresh interval for the session key used in a WPA-enterprise security configuration.  
Use the **no** variant of this command to set the refresh interval to the default.

**Syntax** `session-key-refresh-interval <0-86400>`  
`no session-refresh-key-interval`

| Parameter                    | Description                      |
|------------------------------|----------------------------------|
| <code>&lt;0-86400&gt;</code> | The refresh interval in seconds. |

**Default** The default refresh interval is 0 seconds.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** This command is for TQ series devices only.

**Example** To set 7200 seconds as the session key refresh rate, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wep-ent)#
session-key-refresh-interval 7200
```

**Related commands** [security \(wireless\)](#)  
[session-timeout-interval \(wireless network-cp\)](#)

**Command changes** Version 5.4.7-2.4: command added

# session-timeout-action (wireless network-cp)

**Overview** Use this command to limit the connection time for clients on a Captive Portal session. When the session times-out, the client will either be presented with the authentication page or be disconnected.

Use the **no** variant of this command to revert to the default action.

**Syntax** `session-timeout-action {reauthentication|disconnection}`  
`no session-timeout-action`

| Parameter                     | Description   |
|-------------------------------|---|
| <code>reauthentication</code> | The client must re-authenticate before continuing to use the Captive Portal session.  |
| <code>disconnection</code>    | The client will be disconnected when the Captive Portal session expires. The client can decide whether or not to go through the process of re-authentication. |

**Default** Reauthentication.

**Mode** Wireless Network Captive Portal Configuration

**Usage notes** This command will not work if the **session-timeout-interval** command is set to a non-zero value.

**Example** To disconnect an AP after its Captive Portal session has expired, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-timeout-action
disconnection
```

**Related commands** [show wireless network](#)  
[session-timeout-interval \(wireless network-cp\)](#)

**Command changes** Version 5.5.1-2.1: command added

# session-timeout-interval (wireless network-cp)

**Overview** Use this command to set the session-timeout-interval for authenticated clients in a Captive Portal configuration.

Use the **no** variant of this command to revert to the default session-timeout-interval value.

**Syntax** `session-timeout-interval <0-86400>`  
`no session-timeout-interval`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;0-86400&gt;</code> | The session-timeout-interval value in seconds. To disable the timeout function, set a value of '0' seconds. |

**Default** 3600 seconds.

**Mode** Wireless Network Captive Portal Configuration

**Example** To configure a session-timeout-interval of 1800 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# session-timeout-interval
1800
```

# show wireless ap capability

**Overview** Use this command to display the configured specifications of a supported wireless Access Point (AP).

**Syntax** `show wireless ap capability`  
`show wireless ap capability hwtype <modelname>`  
`show wireless ap capability hwtype {tq|mws}`  
`[single|dual|triple] [spec {11ac|11n}] [radio {1|2|3}] [country`  
`<country-code>]`

| Parameter      | Description  |
|----------------|--|
| hwtype         | To specify the display of a hardware type. When omitted, all hardware types will be displayed.                             |
| <modelname>    | The model name of the wireless AP capabilities to be displayed. See <a href="#">hwtype</a> for a full list of model names. |
| tq             | Display hardware type AT-TQ series only.   |
| mws            | Display hardware type AT-MWS series only.  |
| single         | Display a single radio interface.  |
| dual           | Display a dual radio interface.  |
| spec           | To specify the display of an IEEE wireless networking standard mode. When omitted, all modes are displayed.                |
| 11ac           | Display information for the 802.11ac mode only.  |
| 11n            | Display information for the 802.11n mode only.   |
| radio          | To specify a radio bandwidth. When omitted, all radio bandwidths are displayed.  |
| 1              | Display information for radio bandwidth 2.4GHz only.   |
| 2              | Display information for radio 2 bandwidth 5GHz only.   |
| 3              | Display information for radio 3 bandwidth 5GHz only.   |
| country        | To specify the display for a country. When omitted, the default country will be displayed.                                 |
| <country-code> | Display the specified country code. The default country code is 'jp' for Japan or 'us' for other regions.                  |

**Related commands** [radio \(wireless-ap\)](#)

**Command changes** Version 5.4.7-2.4: command added

# show wireless ap neighbors

**Overview** Use this command to display the neighboring wireless Access Points (APs) connected to a radio or range of radios. If no parameters are specified, then all configurations are displayed.

**Syntax** `show wireless ap [<ap-id-range>|all] neighbors [radio <1-3>]`

| Parameter     | Description   |
|---------------|---|
| <ap-id-range> | Show the radio and wireless neighbors associated with an AP or range of APs. To select a range, use the range format <1-65535>. |
| all           | Display the radio and neighbors for all APs.  |
| radio         | Display the configured radio.   |
| <1-3>         | Radio interface number.   |

**Mode** User Exec and Privileged Exec

**Usage notes** If the total number of AP neighbors in the system exceeds 12500, this command will only show the first 12500 neighbors. You can specify the AP ID to see all neighbors of each AP.

**Example** To display all wireless AP neighbors, use the following command:

```
awplus# show wireless ap neighbors
```

captive-portal virtual-ip

**Command changes** Version 5.4.7-2.4: command added

# show wireless captive-portal network walled-garden

**Overview** Use this command to display wireless network walled garden entries for Captive Portal.

**Syntax** `show wireless captive-portal {<network-ID>|all} walled-garden`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;network-ID&gt;</code> | Display output for the specified wireless network ID or range of network IDs, valid network IDs are <1- 65535>. |
| <code>all</code>                | Display all wireless network walled garden entries.   |

**Mode** Privileged Exec

**Example** To display the walled garden entries for Captive Portal on network 5, use the commands:

```
awplus# show wireless captive-portal network 5 walled-garden
```

**Output** Figure 61-14: Example output from **show wireless captive-portal network 5 walled-garden**

```
awplus#show wireless captive-portal network 5 walled-garden
WALLED GARDEN LIST FOR NETWORK ID 5:
Entries ..... 3
  Walled Garden
  -----

**Command changes** Version 5.5.0-1.3: command added

# show wireless channel-blanket ap status

**Overview** Use this command to display the channel blanket status for a single or range of wireless APs. An AP whose AP ID is displayed as "-" is an AP that is not part of an AWC Lite configuration. If an AP ID (or range) is not selected, then the status of all APs will be displayed.

**Syntax** `show wireless channel-blanket ap {<ap-idrange> | all} status`

| Parameter                       | Description                                   |
|---------------------------------|---|
| <code>&lt;ap-idrange&gt;</code> | The AP ID, or range of IDs <1-65535>.         |
| <code>all</code>                | Display the channel blanket status of all APs |

**Mode** Privileged Exec

**Example** To display the wireless channel blanket status for AP 100, use the command:

```
awplus# show wireless channel-blanket ap 100 status
```

**Output** Figure 61-15: Example output from **show wireless channel-blanket ap status**

```
awplus#show wireless channel-blanket ap 100 status

**Command changes** Version 5.4.9-1.1: command added

# show wireless channel-blanket ap-profile status

**Overview** Use this command to display the channel blanket status of AP profiles. The command displays the number of channel blanket APs configured and visible from each AP to which the profile is assigned. An AP whose member is displayed as "-" is an AP that is not part of the channel blanket. If an AP Profile (or range) is not selected, then all APs profiles will be displayed.

**Syntax** `show wireless channel-blanket ap-profile {<profile-id> | all} status`

| Parameter    | Description                                      |
|--------------|--|
| <profile-id> | The AP Profile ID, or range of IDs <1-65535>.    |
| all          | Display the status of all APs in the AP profile. |

**Mode** Privileged Exec

**Example** To display the wireless channel blanket status for APs belonging to AP profile 100, use the following command:

```
awplus# show wireless channel-blanket ap-profile 100 status
```

**Output** Figure 61-16: Example output from **show wireless channel-blanket ap-profile**

# show wireless wds

**Overview** Use this command to display the configuration of a Wireless Distribution System (WDS) with Autonomous Wave Control. A WDS enables the wireless interconnection of Access Points (APs) or Peers in an IEEE802.11 network.

**Syntax** `show wireless wds [<wds-id-range>][brief]`

| Parameter      | Description   |
|----------------|---|
| <wds-id-range> | Display the configured information for a specified ID or a range of IDs. To display a range of WDS IDs, use the format <1-65535>. |
| brief          | Display a brief summary of the WDS configuration.   |

**Mode** User Exec and Privileged Exec

**Example** To display the full detail of a WDS configuration for a wireless network, use the following command:

```
awplus# show wireless wds
```

**Output** Figure 61-28: Example output from **show wireless wds**

```
awplus#show wireless wds
WDS ID 1: Enable

# show wireless wireless-mac-filter

**Overview** Use this command to display the wireless MAC filter configuration for Autonomous Wave Control.

**Syntax** `show wireless wireless-mac-filter [<mac-filter-range>|all]  
[brief]`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>&lt;mac-filter-range&gt;</code> | <code>&lt;1-65535&gt;</code><br>Display the information for a specified ID or range of IDs. |
| <code>all</code>                      | Display the information for all MAC filters.  |
| <code>brief</code>                    | Display a brief summary of the information  |

**Mode** Privileged Exec

**Output** Figure 61-30: Example output from **show wireless-mac-filter**

```
awplus#show wireless wireless-mac-filter

WIRELESS MAC FILTER ID 100:
  Description ..... Floor 1
  Entries ..... 3
  Entries ..... 2
    MAC address      Description
    -----
    1234.5678.abcd  PC lab 1
    0987.6543.abcd  guest
    abcd.9876.5432

WIRELESS MAC FILTER ID 200:
  Description .....
  Entries ..... 0
```

# show wireless wireless-trigger

**Overview** Use this command to display the wireless trigger status on a wireless network.

**Syntax** `show wireless wireless-trigger [all|<trigger-id>]`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;trigger-id&gt;</code> | Select an ID number between 1-8. You can also select a range of IDs using a comma separated list. |

**Default** All

**Mode** Privileged Exec and User Exec

**Example** To display the status for all wireless triggers, use the commands:

```
awplus# show wireless wireless-trigger
```

**Output** Figure 61-31: Example output from **show wireless wireless-trigger**

```
awplus> show wireless wireless-trigger
Wireless Trigger ID 1:
  Description ..... Trigger 1
  Status ..... Inactive
Wireless Trigger ID 2:
  Description ..... Trigger 2
  Status ..... Active
  Activated User ..... Admin
  Activated Time ..... 2020-12-28 12:11:34
```

# smart-connect-profile

**Overview** Use this command to create a Smart Connect profile and enter the Smart Connect profile configuration mode.

Use the **no** variant of this command to delete a Smart Connect profile from the wireless configuration.

**Syntax** `smart-connect-profile <1-65535>`  
`no smart-connect-profile <1-65535>`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-65535> | The Smart Connect profile ID |

**Default** Not set

**Mode** Wireless Configuration

**Example** To configure Smart Connect profile 10 and enter the Smart Connect profile configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 10
awplus(config-wireless-sc-prof)#
```

To delete Smart Connect profile 10, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no smart-connect-profile 10
```

**Related commands**

**Command changes** Version 5.5.0-0.1: command added

# snmp (wireless-ap-prof)

**Overview** Use this command to enter SNMP configuration mode so you can add an SNMP configuration.

Use the **no** variant of this command to reset the SNMP parameters back to the default (not set).

**Syntax** snmp  
no snmp

**Default** Not set

**Mode** Wireless AP Profile Configuration

**Example** To enter the SNMP configuration mode of AP profile 2, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)#
```

To disable SNMP, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# no snmp
awplus(config-wireless-ap-prof)#
```

**Command changes** Version 5.5.0-2.1: command added

# ssid (wireless-network)

**Overview** Use this command to configure the SSID (Service Set Identifier) for the wireless network.

**Syntax** `ssid <value>`

| Parameter                  | Description  |
|----------------------------|--|
| <code>&lt;value&gt;</code> | The unique alphanumeric description or name of the SSID. The maximum character length is 32. |

**Default** Default- {NETWORKID}.

Except for the default Guest Network, the default SSID for each network is 'Default-' followed by the unique Network ID.

**Mode** Wireless Network Configuration

**Usage notes** A network must be configured with an SSID of one or more alphanumeric characters. The SSID can be modified, but cannot be deleted.

**Example** To configure a SSID name for a wireless network, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# ssid GUEST_NETWORK_1
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added.

# ssid (wireless-sc-prof)

**Overview** Use this command to set the SSID used for wireless communication between APs in a Smart Connect network.

Use the **no** variant of this command to remove the SSID from a Smart Connect profile.

**Syntax** `ssid <ssid-value>`  
`no ssid`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;ssid-value&gt;</code> | The SSID for the Smart Connect network. Enter a string up to 32 characters in length. |

**Default** Not set

**Mode** Wireless Smart Connect Profile Configuration

**Example** To set the SSID ID of 10 used for wireless communication between APs in Smart Connect network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# smart-connect-profile 20
awplus(config-wireless-sc-prof)# ssid SC-NETWORK-10
```

**Related commands** [sc-profile](#)  
[show wireless ap-profile](#)  
[show wireless network](#)

**Command changes** Version 5.5.0-0.1: command added

# station-isolation enable

**Overview** Use this command to enable to the station-isolation option on channel blanket for a wireless AP profile. When station-isolation is enabled, the AP blocks communication between wireless clients on the same virtual access point (VAP). The AP still allows data traffic between its wireless clients and wired devices on the network.

Use the **no** variant of this command to disable the station-isolation option.

**Syntax** station-isolation enable  
no station-isolation enable

**Default** Disabled.

**Mode** Wireless AP Profile Channel Blanket Configuration

**Example** To enable station-isolation for channel blanket on AP profile 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# channel-blanket
awplus(config-wireless-ap-prof-cb)# station-isolation enable
```

**Related commands** [ap-profile \(wireless-ap\)](#)  
[show wireless ap-profile](#)  
[channel-blanket](#)

**Command changes** Version 5.4.9-1.1: command added

# station-isolation enable (wireless-ap-prof-radio)

**Overview** Use this command to enable the **station-isolation** option. This option designates whether to allow communication between wireless clients which are connected to the same Virtual Access Point (VAP).

Use the **no** variant of this command to disable the station-isolation option on a selected VAP.

**Syntax** station-isolation enable  
no station-isolation enable

**Default** Disabled.

**Mode** Wireless AP Profile Radio Configuration

**Example** To enable the station-isolation option for **radio 2** on **ap-profile100**, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# station-isolation
enable
```

**Related commands** [radio \(wireless-ap-profile\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# task

**Overview** Use this command to configure an Autonomous Wave Control (AWC) task. If the task doesn't exist, then this command creates it. Use the **no** variant of this command to remove the task.

**Syntax** task <1-65535>  
no task <1-65535>

| Parameter | Description    |
|-----------|----------------|
| <1-65535> | Task ID number |

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** A task is a configuration for a periodic or scheduled action to be taken. For example, the task may be to run a configuration, start an AWC calculation, or download AP firmware. Use commands such as **description**, **time**, and **day** to configure the task actions.

**Example** To add a task with an ID of 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 10
```

To remove task ID 10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no task 10
```

**Related commands** enable (wireless-task)  
description (wireless-task)  
time (wireless-task)  
day (wireless-task)  
type download ap (wireless-task)  
type ap-configuration apply ap  
type power-channel ap all

**Command changes** Version 5.4.7-2.4: command added

# time (wireless-task)

- Overview** Use this command to set a time to run a task using the 24-hour format.
- You can use the **day** command along with the **time** command to more fully set the task run time configuration.
- Use the **no** variant of this command to remove the time set to run a task.

**Syntax** `time <HH:MM>`  
`no time`

| Parameter                  | Description  |
|----------------------------|--|
| <code>&lt;HH:MM&gt;</code> | The time set to run a task in 24-hour time format. |

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To set task 5 to run at 11:15 pm, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# time 23:15
```

**Related commands** [task](#)  
[show wireless task](#)  
[day \(wireless-task\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# trap host (wireless-ap-prof-snmp)

**Overview** Use this command to add an SNMP trap host to the entry for the target AP Profile. Use the **no** variant of this command to remove the specified SNMP trap host from the entry.

**Syntax** trap host <host-name>  
no trap host <host-name>

| Parameter   | Description   |
|-------------|---|
| <host-name> | The host that sends the SNMP trap. Specify the host name (FQDN) or IP address. For example manager.your.domain.com, 10.10.1.37. |

**Default** The entry is empty.

**Mode** Wireless AP Profile SNMP Configuration

**Usage notes** The maximum number of registrations is 3 entries.

**Example** To add the SNMP trap host 192.168.1.1 to the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# trap host 192.168.1.1
```

To remove the SNMP trap host 192.168.1.1 from the entry, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no trap host 192.168.1.1
```

**Related commands** [enable \(wireless-ap-prof-snmp\)](#)  
[show wireless ap-profile](#)  
[snmp \(wireless-ap-prof\)](#)

**Command changes** Version 5.5.0-2.1: command added

# type (wireless-sec-wep)

**Overview** Use this command to assign the key-string type for a wireless security WEP configuration.

Use the **no** variant of this command to reset the assigned WEP key-string type to the default.

**Syntax** type {ascii|hex}  
no type

| Parameter | Description                           |
|-----------|---------------------------------------|
| ascii     | Use ASCII as the type for the WEP key |
| hex       | Use Hex as the type for the WEP key   |

**Default** Hex.

**Mode** Wireless Security WEP Configuration

**Example** To configure ASCII as the key-string type for WEP for a wireless security WEP configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10 mode wep
awplus(config-wireless-sec-wep)# type ascii
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# type ap-configuration apply ap

**Overview** Use this command to apply a task configuration type to a selected wireless Access Point (AP) or range of wireless APs.

**Syntax** `type ap-configuration apply ap {all|<ap-id-range>}`

| Parameter     | Description   |
|---------------|---|
| all           | Apply the configuration to all APs.                 |
| <ap-id-range> | Apply the configuration to a selected range of APs. |

**Default** Not set.

**Mode** Wireless Task Configuration

**Example** To assign task 5 configuration to wireless AP ranges: 5-9 and 15-19, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type ap-configuration apply ap
5-9,15-19
```

**Related commands**

- [task](#)
- [show wireless task](#)
- [ap](#)
- [type download ap \(wireless-task\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# type download ap (wireless-task)

**Overview** Use this command to download and update wireless Access Point (AP) firmware. The firmware must be stored on an HTTP server.

**Syntax** `type download ap {all|<ap-id-range>} url <URL> [username <user-name> password <password>]`

| Parameter     | Description  |
|---------------|--|
| all           | Run the task on all managed APs.                                 |
| <ap-id-range> | Run the task on the selected identifier.                         |
| <URL>         | The URL where the firmware is stored and can be downloaded from. |
| <user-name>   | The username requiring authentication and access to the URL.     |
| <password>    | The password requiring authentication and access to the URL.     |

**Mode** Wireless Task Configuration

**Example** To set a task to download new firmware from the IP address 192.168.0.1 to a wireless AP which is assigned '7' as its identifier, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config-wireless-task)# type download ap 7 url
http://192.168.0.1/AT-TQ4600-4.0.3.b02.img
```

**Related commands**

- [task](#)
- [show wireless task](#)
- [ap](#)
- [type ap-configuration apply ap](#)
- [type power-channel ap all](#)

**Command changes** Version 5.4.7-2.4: command added.

# type power-channel ap all

**Overview** Use this command to calculate the power usage on wireless Access Point (AP) channels and apply the results manually or automatically.

**Syntax** `type power-channel ap all {calculate|apply|calculate-and-apply}`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>calculate</code>           | Run the AWC power calculation on all APs.                       |
| <code>apply</code>               | Apply the latest AWC power calculation results to all APs.      |
| <code>calculate-and-apply</code> | Run the AWC power calculation and apply the results to all APs. |

**Default** Not set.

**Mode** Wireless Task Configuration

**Usage notes** This command allows you to monitor how APs are being utilized at various times and adjust AP power levels if required.

**Example** To calculate all AP power-channel usage and apply the results to all APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# task 5
awplus(config)# type power-channel ap all calculate-and-apply
```

# unauth-emergency-service-access enable (wireless-network-passpoint-dot11u)

**Overview** Use this command to configure unauthenticated access to emergency services. This makes emergency services available to any user, with or without a valid authentication credential.

Use the **no** variant of this command to disable unauthenticated access to emergency services.

**Syntax** `unauth-emergency-service-access enable`  
`no unauth-emergency-service-access enable`

**Default** Disabled.

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To configure unauthenticated access to emergency services, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)#
unauth-emergency-service-access enable
```

**Related commands** [show wireless network](#)  
[dot11u \(wireless-network-passpoint\)](#)

**Command changes** Version 5.5.0-2.3: command added

# username (wireless-ap-prof-snmp)

**Overview** Use this command to set an SNMP version v3 username and password for the target AP profile. This command is valid for SNMP version v3 only.

Use the **no** variant of this command to remove an SNMP username and password.

**Syntax** `username <username> password [encrypted] <password>`  
`no username`

| Parameter  | Description   |
|------------|---|
| <username> | The user name that is used for user authentication and encryption. Enter up to 12 alphanumeric characters. The user name cannot begin with a number.  |
| encrypted  | Indicates that the following password is in its encrypted form. Its primary purpose is to use to store the shared key to startup-configuration. You should not use it when entering the command manually. |
| <password> | The password is used for encryption. Enter from 8 to 32 characters. Valid characters are:<br>- alphanumeric characters<br>- symbols except for the following 8 symbols: " \$ & ' * : < >                  |

**Default** Not set

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP username to 'manager' and the password to 'friend001', use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# username manager
awplus(config-wireless-ap-prof-snmp)# password friend001
```

To remove the SNMP username and password, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof)# no username
```

**Related commands**

- Version 5.5.0-2.1: command added

# vap

**Overview** Use this command to assign a network configuration ID to a Virtual Access Point (VAP) on the radio.

Use the **no** variant of this command to remove a specific VAP configuration.

**NOTE:** The channel-blanket setting can only be used with AT-TQ5403 and AT-TQ5403e APs. If this is set for other APs, you will not be able to manage those APs. Also, even if the AP profile for AT-TQ5403 or AT-TQ5403e does not include the Channel Blanket setting, those AT-TQ5403 or AT-TQ5403e will not be manageable.

**Syntax** `vap <vap-id> network <network-id> [channel-blanket]`  
`no vap <vap-id>`

| Parameter       | Description                                    |
|-----------------|--|
| <vap-id>        | Enter the VAP ID in the range of <0-7>         |
| <network-id>    | Enter the network ID in the range of <1-65535> |
| channel-blanket | Set the VAP to channel blanket mode            |

**Default** Not set.

**Mode** Wireless AP Profile Radio Configuration

**Example** To associate a network (ID 100) with the VAP 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# vap 2 network 100
```

To associate a network (ID 100) with the VAP 2 as channel blanket mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# radio 2
awplus(config-wireless-ap-radio)# vap 2 network 100
channel-blanket
```

**Related commands** [network \(wireless\)](#)  
[radio \(wireless-ap-profile\)](#)  
[show wireless channel-blanket ap status](#)

show wireless channel-blanket ap-profile status

**Command changes** Version 5.4.9-1.1: command added

# vap network (wireless-ap-prof-radio)

**Overview** Use this command to assign a network configuration ID to a Virtual Access Point (VAP) on a radio.

Use the **no** variant of this command to remove the network configuration for a VAP.

**Syntax** vap <0-7> network <1-65535>  
no vap <0-7>

| Parameter | Description                                 |
|-----------|---|
| <0-7>     | VAP identification number                   |
| <1-65535> | Network configuration of the designated VAP |

**Default** Not set.

**Mode** Wireless AP Profile Radio Configuration

**Usage notes** vap0 is the only VAP identification number valid on the **MWS series**.

**Example** To associate an AP with network (ID 100) to VAP 2, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 100
awplus(config-wireless-ap-prof)# radio 2
awplus(config-wireless-ap-prof-radio)# vap 2 network 2
```

**Related commands** [radio \(wireless-ap-profile\)](#)  
[network \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.

# venue group (wireless-network-passpoint-dot11u)

**Overview** Use this command to designate the venue group used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to reset a venue group.

**Syntax** venue group <0-255>  
no venue group

| Parameter | Description  |
|-----------|--|
| <0-255>   | The venue group code. See IEEE 802.11-2016, Table 9-61 page 756. |

**Default** 7

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set a venue group, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue group
2
```

**Related commands** [show wireless network](#)  
[venue type \(wireless-network-passpoint-dot11u\)](#)

**Command changes** Version 5.5.1-1.1: command added.

# venue name (wireless-network-passpoint-dot11u)

**Overview** Use this command to designate the venue name and language code used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to remove a venue name.

**Syntax** venue name <1-10> lang <lang-code> name <venue-name>  
no venue name <1-10>

| Parameter    | Description  |
|--------------|--|
| <1-10>       | The venue name identifier number. If the specified identifier number does not exist, then a new one will be created. If it does exist, the language code and venue name will be overwritten. |
| <lang-code>  | The language code. The code is 2 or 3 characters as specified in ISO-639. For example, 'eng', 'jpn'  |
| <venue-name> | The venue name. <ul style="list-style-type: none"><li>You can enter up to 10 separate entries</li><li>The maximum number of characters is 252.</li></ul>                                     |

**Default** No name is set

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set a venue name, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue name 1
lang eng name Allied Telesis Ltd
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.1-1.1: command added.

# venue type

## (wireless-network-passpoint-dot11u)

**Overview** Use this command to designate the venue type used in a Passpoint 802.11u wireless configuration.

Use the **no** variant of this command to reset a venue type.

**Syntax** venue type <0-255>  
no venue type

| Parameter | Description   |
|-----------|---|
| <0-255>   | The venue type code. See IEEE 802.11-2016, Table 9-62 page 756-759. |

**Default** 1

**Mode** Wireless Network Passpoint 802.11u Configuration

**Example** To set a venue type, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# dot11u
awplus(config-wireless-network-passpoint-dot11u)# venue type 2
```

**Related commands** [show wireless network](#)

**Command changes** Version 5.5.1-1.1: command added.

# version (wireless-ap-prof-snmp)

**Overview** Use this command to set the SNMP agent version for the target AP profile.  
Use the **no** variant of this command to set it back to the default (v1 and v2c).

**Syntax** `version {v1v2c|v3}`  
`no version`

| Parameter | Description                                      |
|-----------|--|
| v1v2c     | Set when the SNMP agent version is at v1 or v2c. |
| v3        | Set when the SNMP agent version is v3.           |

**Default** v1v2c

**Mode** Wireless AP Profile SNMP Configuration

**Example** To set the SNMP version as v3, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# version v3
```

To set the SNMP listening port back to the default (v1v2c), use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 2
awplus(config-wireless-ap-prof)# snmp
awplus(config-wireless-ap-prof-snmp)# no version
```

**Command changes** Version 5.5.0-2.1: command added

# versions (wireless-sec-osen)

**Overview** Use this command to set which Wi-Fi Protected Access (WPA) version to use with OSEN wireless security configuration. OSEN is Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. It is used with Release 2 of Hotspot 2.0 (Passpoint).

Use the **no** variant of this command to revert to the default setting (WPA2).

**Syntax** `versions <version-list>`  
`no versions`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;version-list&gt;</code> | The supported WPA version(s) list. The list can use either <b>wpa</b> or <b>wpa2</b> or <b>wpa3</b> , or two of these three, or all in any order.<br>OSEN only allows the following combinations: <ul style="list-style-type: none"><li>• two combinations of <b>wpa</b> and <b>wpa2</b></li><li>• <b>wpa</b> only</li><li>• <b>wpa3</b> only</li></ul> |

**Default** WPA2.

**Mode** Wireless Security OSEN Configuration

**Usage notes** OSEN is a wireless security method used with Release 2 of Hotspot 2.0 (Passpoint) OSEN is short for Online Sign Up (OSU) Server-only Authenticated Layer 2 Encryption Network. Use the **security** command to enter OSEN security configuration mode.

**Example** To set both WPA and WPA2 as WPA versions on a security configuration of OSEN, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode osen
awplus(config-wireless-sec-osen)# versions wpa wpa2
```

**Command changes** Version 5.5.0-2.3: command added

# versions (wireless-sec-wpa-ent)

**Overview** Use this command to set the WPA version used for a WPA-enterprise wireless security configuration.

Use the **no** variant of this command to reset the designated version to the default.

**Syntax** `versions <version-list>`  
`no versions`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;version-list&gt;</code> | The version list. You can use either <b>wpa</b> , <b>wpa2</b> , <b>wpa3</b> , or any combination of the three in any order. |

**Default** `wpa2`.

**Mode** Wireless Security WPA-enterprise Configuration

**Usage notes** For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

**Example** To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-enterprise, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 210 mode wpa-enterprise
awplus(config-wireless-sec-wpa-ent)# versions wpa wpa2
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.  
Version 5.4.9-1.1: **wpa3** parameter added.

# versions (wireless-sec-wpa-psnl)

**Overview** Use this command to set the WPA version used for a WPA-personal wireless security configuration.  
Use the **no** variant of this command to reset the designated version to the default.

**Syntax** `versions <version-list>`  
`no versions`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;version-list&gt;</code> | The version list. You can use either <b>wpa</b> , <b>wpa2</b> , <b>wpa3</b> , or any combination of the three in any order. |

**Default** `wpa2`.

**Mode** Wireless Security WPA-personal Configuration

**Usage notes** For MWS series devices, a combination of versions and ciphers are supported as follows:

- versions WPA2 and ciphers CCMP
- versions WPA, WPA2, and ciphers TKIP and CCMP

WPA3 is only supported on TS5403 series devices.

**Example** To configure both WPA and WPA2 as WPA versions on a security configuration for WPA-personal, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# security 110 mode wpa-personal
awplus(config-wireless-sec-wpa-psnl)# versions wpa wpa2
```

**Related commands** [security \(wireless\)](#)

**Command changes** Version 5.4.7-2.4: command added.  
Version 5.4.9-1.1: **wpa3** parameter added.

# vlan (wireless-network)

**Overview** Use this command to configure the wireless VLAN that clients belong to.  
Use the **no** variant of this command to reset the wireless VLAN to the default.

**Syntax** `vlan <1-4094>`  
`no vlan`

| Parameter | Description     |
|-----------|-----------------|
| <1-4094>  | VLAN ID number. |

**Default** VLAN1.

**Mode** Wireless Network Configuration

**Example** To configure a VLAN ID, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# vlan 100
```

To restore VLAN 20 to its default value, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# no vlan
```

**Related commands** [network \(wireless\)](#)  
[show wireless network](#)

**Command changes** Version 5.4.7-2.4: command added

# walled-garden entry

**Overview** Use this command to configure walled garden entry to a wireless network Captive Portal.

On the Internet, a walled garden typically controls a user's access to web content and services. The walled garden directs the user's navigation within particular areas to allow access to a selection of websites or prevent access to other websites.

A common example could be a hotel environment where unauthenticated users are allowed to navigate to a designated login page (for example, a hotel website) and all its contents.

Use the **no** variant of this command to remove a walled garden on a wireless network that's configured with a Captive Portal.

**Syntax** `walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}`  
`no walled-garden entry {A.B.C.D|A.B.A.D/M|FQDN}`

| Parameter | Description  |
|-----------|--|
| A.B.C.D   | IPv4 address format, e.g. 1.1.1.1  |
| A.B.C.D/M | IPv4 address format with subnet mask, e.g. 1.1.1.0/24  |
| FQDN      | FDQN format.<br>Sequence of {LETTER/DIGIT/HYPHEN}.{LETTER/DIGIT/HYPHEN}...while each dotted part of the name (aa or bb or cc in this example) MUST NOT end with HYPHEN and the first character MUST be a LETTER or a DIGIT. And each dotted part (aa or bb or cc in this example) must be 63 characters or less, e.g. example.com<br>www.example.com |

**Default** Not set

**Mode** Wireless Network Captive Portal Configuration

**Example** To add a new entry to a walled garden list on Captive Portal for network 20, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 20
awplus(config-wireless-network)# captive-portal
awplus(config-wireless-network-cp)# walled-garden entry
example.com
```

# wan-metrics downlink-load (wireless-network-passpoint-hs20)

**Overview** Use this command to set the wan-metrics downlink-load for Hotspot 2.0.  
Use the **no** variant of this command to revert to the default value.

**Syntax** wan-metrics downlink-load <0-255>  
no wan-metrics downlink-load

| Parameter | Description  |
|-----------|--|
| <0-255>   | WAN Metrics Down Link Load value<br>Calculation formula: WAN line load factor (%) /100*255<br>For example: 75% -> 75/100*255=191 |

**Default** 80.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set a WAN Metrics Down Link Load of 191, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics
downlink-load 191
```

**Command changes** Version 5.5.0-2.3: command added

# wan-metrics downlink-speed (wireless-network-passpoint-hs20)

**Overview** Use this command to set the wan-metrics downlink-speed for Hotspot 2.0.  
Use the **no** variant of this command to revert to the default value.

**Syntax** wan-metrics downlink-speed <1-4294967295>  
no wan-metrics downlink-speed

| Parameter      | Description                        |
|----------------|------------------------------------|
| <1-4294967295> | WAN Metrics Down Link Speed (kbps) |

**Default** 8000.

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set a WAN Metrics Down Link Speed of 191 kbps, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20
awplus(config-wireless-network-passpoint-hs20)# wan-metrics

# wan-metrics info (wireless-network-passpoint-hs20)

**Overview** Use this command to configure the WAN Metrics Link Status information for Hotspot 2.0.

Use the **no** variant of this command to revert to the default value.

**Syntax** wan-metrics info <HEX-value>  
no wan-metrics info

| Parameter   | Description   |
|-------------|---|
| <HEX-value> | A one or two digit hexadecimal number.  |
|             | Calculation formula: . <ul style="list-style-type: none"><li>• (At Capacity &lt;&lt; 3)   (Symmetric Link &lt;&lt; 2)   (Link Status &amp; 0x3)</li></ul> Bit placement: <ul style="list-style-type: none"><li>• Bit[3]: At Capacity</li><li>• Bit[2]: Symmetric Link</li><li>• Bit[1:0]: Link Status</li></ul> <b>At Capacity:</b> Set to 1 to notify you that the line capacity on the WAN side has reached the upper limit.<br><b>Symmetric Link:</b> Set to 1 to notify you that Uplink/Downlink speed are the same value.<br><b>Link Status:</b> Configure as shown below: <ul style="list-style-type: none"><li>• 1 (0b01) : Link up</li><li>• 2 (0b10) : Link down</li><li>• 3 (0b11) : Link in test state</li></ul> |

**Default** 01

**Mode** Wireless Network Passpoint Hotspot 2.0 Configuration

**Example** To set the WAN Metrics Link Status information, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 1
awplus(config-wireless-network)# passpoint
awplus(config-wireless-network-passpoint)# hs20

# wds

**Overview** Use this command to add a Wireless Distribution System (WDS) configuration. Use the **no** variant of this command to remove a WDS configuration.

**Syntax** `wds <1-65535>`

| Parameter                    | Description                  |
|------------------------------|------------------------------|
| <code>&lt;1-65535&gt;</code> | WDS configuration ID number. |

**Default** Not set.

**Mode** Wireless Configuration

**Usage notes** This command adds a WDS configuration and enters the configuration mode.

**Example** To add a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wds 10
```

To remove a WDS configuration for AWC, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wds 10
```

## wds radio (wireless-ap)

**Overview** Use this command to designate a radio interface for an Access Point (AP) in a Wireless Distribution System (WDS) network.

Use the **no** variant of this command to remove a wireless radio interface.

**Syntax** `wds radio <1-3>`  
`no wds radio`

| Parameter | Description   |
|-----------|---|
| <1-3>     | Designate a radio interface for the WDS connection. |

**Default** Not set.

**Mode** Wireless AP Configuration

**Example** To configure 'radio 2' as the radio interface for a WDS connection, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap 100
awplus(config-wireless-ap)# wds radio 2
```

# web-auth radius auth group

**Overview** Use this command to enable Web authentication of clients with a RADIUS group in a wireless network.

Use the **no** variant of this command to disable Web authentication with a RADIUS group.

**Syntax** `web-auth radius auth group {radius|<group-name>}`  
`no web-auth radius auth group`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>radius</code>             | Use a RADIUS group, which means <b>all</b> RADIUS servers. |
| <code>&lt;group-name&gt;</code> | The RADIUS server group.                                   |

**Default** Not set.

**Mode** Wireless Network.

**Usage notes** This command enables Web authentication and designates a RADIUS server group to authenticate clients on a wireless network. RADIUS server groups are defined using the **aaa group server** command. RADIUS server groups can consist of multiple server hosts, but this command only uses two servers.

**Example** To enable Web authentication with a RADIUS server group, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 10
awplus(config-wireless-network)# web-auth radius auth group
radius
```

**Related commands** [aaa group server](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless

**Overview** Use this command to enter wireless configuration mode.  
Use the **no** variant of this command to exit wireless configuration mode.

**Syntax** wireless  
no wireless

**Mode** Global Configuration

**Example** To enter wireless configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)#
```

**Command changes** Version 5.4.7-2.4: command added.

# wireless ap-configuration apply ap

**Overview** Use this command to apply a configuration to a single Access point (AP) or a range of APs. The configuration must exist before you use this command.

**Syntax** `wireless ap-configuration apply ap {all|<ap-idrange>}`

| Parameter    | Description   |
|--------------|---|
| all          | Apply the configuration to all APs.                                     |
| <ap-idrange> | Apply the configuration to a range of APs. The range format is 1-65535. |

**Mode** Privileged Exec

**Example** To apply a configuration to the AP range 1-10, use the command:

```
awplus# configure terminal
awplus(config)# wireless ap-configuration apply 1-10
```

To apply a configuration to all APs, use the command:

```
awplus# wireless ap-configuration apply ap all
```

**Related commands** [ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless channel-blanket ap-profile bssid-renew

**Overview** Use this command to renew the BSSID assigned to the channel blanket for the specified AP-profile(s).

**Syntax** `wireless channel-blanket ap-profile  
{<ap-profile-id-range>|all} bssid-renew`

| Parameter                                | Description   |
|--|---|
| <code>&lt;ap-profile-id-range&gt;</code> | Renew the BSSID of the channel blanket for a specific AP-profile or range of AP-profiles <1-65535>. |
| <code>all</code>                         | Renew the BSSID of the channel blanket for all AP-profiles.   |

**Default** Not set.

**Mode** Privileged Exec

**Example** To renew the channel blanket BSSID for AP-profile 1 and 2, use the commands:

```
awplus# wireless channel-blanket ap-profile 1,2 bssid-renew
```

**Related commands** [show wireless ap-profile](#)  
[vap](#)

**Command changes** Version 5.5.1-0.1: command added

# wireless download ap url

**Overview** Use this command to download Access Point (AP) firmware from a URL.

**Syntax** wireless download ap {all|<aprange>} url [username <user-name>  
password <password>]

| Parameter            | Description   |
|----------------------|---|
| all                  | All APs.  |
| <aprange>            | A range of APs <1-65535>  |
| username <user-name> | The login username.<br><br>The username can contain: <ul style="list-style-type: none"><li>• up to 255 characters.</li><li>• any printable ASCII characters (ASCII 32-126)</li><li>• special characters: backslash, double-quote or space, but they should be escaped with a backslash.</li></ul> |
| password <password>  | Passwords can be up to 64 characters in length and can contain printable characters, except: <ul style="list-style-type: none"><li>• ?</li><li>• "(double quotes)</li><li>• space</li></ul>   |

**Default** Not set.

**Mode** Privileged Exec

**NOTE:** AWC supports the following firmware version:

- TW series: v4.0.5B02
- MWS2533AP: v2.2.1, v2.2.3
- MWS600AP/MWS1750AP: v2.2.3

**Example** To download new firmware to all APs from the URL 192.168.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless download ap all url
http://192.168.0.1/AT-TQ4600-4.0.3.n.b02.img
```

**Related commands** [show wireless ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless emergency-mode

**Overview** Use this command to activate or deactivate AWC emergency mode. Wireless networks that have been flagged for emergency-mode are activated or deactivated when this command is configured.

**Syntax** `wireless emergency-mode {activate|deactivate}`

**Default** Deactivated

**Mode** Privileged Exec

**Example** To activate the emergency mode in AWC, use the command:

```
awplus# wireless emergency-mode activate
```

**Related commands** [emergency-mode](#)  
[show wireless](#)

**Command changes** Version 5.5.0-0.3: command added

# wireless export

**Overview** Use this command to export MAC filter entries to a CSV file. If the specified file does not exist, it will be created. If the file does exist then it will be overwritten with the new data.

**Syntax** `wireless export wireless-mac-filter <mac-filter-id> <url>`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;mac-filter-id&gt;</code> | <code>&lt;1-65535&gt;</code><br>The ID of the MAC filter to export. |
| <code>&lt;url&gt;</code>           | Path and filename of the export file.                               |

**Mode** Privileged Exec

**Example** To export MAC filter '20' to a CSV file named 'whitelist.csv', use the following command:

```
awplus# wireless export wireless-mac-filter 20  
flash://whitelist.csv
```

Figure 61-32: Sample export file:

```
"00:1a:eb:12:34:56","client1"  
"00:1a:eb:12:34:57","client2"  
"00:1a:eb:12:34:58","client3"  
"00:1a:eb:12:34:59","client4"  
"00:1a:eb:12:34:5a","client5"
```

**Command changes** Version 5.4.8-2.1: command added

# wireless import

**Overview** Use this command to import MAC filter entries from a CSV file. The imported entries can either replace or be appended to the existing entries.

**Syntax** `wireless import <url> wireless-mac-filter <mac-filter-id> {add|replace}`

| Parameter       | Description   |
|-----------------|---|
| <url>           | Path and filename of the import file.                           |
| <mac-filter-id> | <1-65535><br>The ID of the MAC filter to import the entries to. |
| add             | Add the filter entries to the specified MAC filter              |
| replace         | Overwrite the existing MAC filter with the imported entries.    |

**Mode** Privileged Exec

**Example** To add MAC filter entries from the file 'whitelist.csv' to MAC filter '20', use the following command:

```
awplus# wireless import flash://whitelist.csv  
wireless-mac-filter 20 add
```

Figure 61-33: Sample import file:

```
"00:1a:eb:12:34:56","client1"  
"00:1a:eb:12:34:57","client2"  
"00:1a:eb:12:34:58","client3"  
"00:1a:eb:12:34:59","client4"  
"00:1a:eb:12:34:5a","client5"
```

**Command changes** Version 5.4.8-2.1: command added

# wireless power-channel ap all

**Overview** This command activates AWC to calculate the optimal power-channel levels for all the Access Points (APs) in a wireless network. You can use this command to calculate and apply the latest AWC calculation results to the APs automatically or you can choose to apply them manually.

**Syntax** `wireless power-channel ap all  
{calculate|apply|calculate-and-apply}`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>calculate</code>           | Use AWC to calculate the optimal power-channel levels for all APs.                                   |
| <code>apply</code>               | Apply the latest AWC optimal power-channel level results to all APs.                                 |
| <code>calculate-and-apply</code> | Use AWC to calculate the optimal power-channel levels for all APs, and apply the results to the APs. |

**Default** Not set.

**Mode** Privileged Exec

**Example** To activate AWC to calculate the optimal power-channel levels for all APs, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless power-channel ap all calculate
```

To apply the latest optimal power-channel results manually to all APs, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless power-channel ap all apply
```

To activate AWC to calculate the optimal power-channel levels for all APs and then automatically apply the results to the APs, use the following commands:

```
awplus# configure terminal  
awplus(config)# wireless power-channel ap all  
calculate-and-apply
```

**Related commands** [show wireless ap power-channel](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless reset ap

**Overview** Use this command to reset the current configuration applied to a wireless Access Point (AP).

**Syntax** `wireless reset ap {all|<aprange>}`

| Parameter | Description                                    |
|-----------|--|
| <aprange> | Reset the range of APs in the format <1-65535> |
| all       | Reset all APs.                                 |

**Mode** Privileged Exec

**Example** To reset the configuration for wireless APs in the range 1-10, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap 1-10
```

To reset the configuration for all wireless APs, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless reset ap all
```

**Related commands** [ap](#)

**Command changes** Version 5.4.7-2.4: command added.

# wireless-mac-filter (wireless)

**Overview** Use this command to configure a wireless MAC filter. If the filter does not already exist it will be created when you issue this command.

Use the **no** variant of this command to remove a wireless MAC filter.

**Syntax** `wireless-mac-filter <mac-filter-id>`  
`no wireless-mac-filter <mac-filter-id>`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;mac-filter-id&gt;</code> | <code>&lt;1-65535&gt;</code><br>Enter the ID of the MAC filter to assign to the AP profile. |

**Default** No MAC filters are set by default.

**Mode** Wireless Configuration

**Example** To add a MAC filter with ID '20' and enter configuration mode for that filter, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-mac-filter 20
awplus(config-wireless-mac-flt)#
```

To remove a MAC filter with ID '20', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-mac-filter 20
```

**Related commands**

**Command changes** Version 5.4.8-2.1: command added

# wireless-mac-filter (wireless-ap-prof)

**Overview** Use this command to assign a MAC filter to a wireless AP profile. You can configure the filter as a 'whitelist' or a 'blacklist'. An AP profile can only have one MAC filter assigned to it.

Use the **no** variant of this command to remove a MAC filter from an AP profile.

**Syntax** `wireless-mac-filter {permit|deny} <mac-filter-id>`  
`no wireless-mac-filter`

| Parameter       | Description  |
|-----------------|--|
| permit          | Set the MAC filter as a whitelist.                                       |
| deny            | Set the MAC filter as a blacklist.                                       |
| <mac-filter-id> | <1-65535><br>Enter the ID of the MAC filter to assign to the AP profile. |

**Default** No MAC filter assigned by default.

**Mode** Wireless AP Profile Configuration

**Example** To assign the MAC filter '20' as a whitelist to wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# wireless-mac-filter permit 20
```

To remove a MAC filter from wireless AP profile '1', use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# ap-profile 1
awplus(config-wireless-ap-prof)# no wireless-mac-filter
```

wireless-mac-filter enable

**Command changes** Version 5.4.8-2.1: command added

# wireless-mac-filter enable

**Overview** Use this command to enable the MAC filter on a Virtual Access Point (VAP). It will enable the MAC filter based on the filter entry set in the AP profile.

Use the **no** variant of this command to disable the AMC filter on a VAP.

**Syntax** `wireless-mac-filter enable`  
`no wireless-mac-filter enable`

**Default** Disabled by default.

**Mode** Wireless Network Configuration

**Example** To enable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# wireless-mac-filter enable
```

To disable wireless MAC filter on APs that use network 100, use the following commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 100
awplus(config-wireless-network)# no wireless-mac-filter enable
```

**Command changes** Version 5.4.8-2.1: command added

# wireless wireless-trigger

**Overview** Use this command to activate or deactivate a wireless-trigger. You can set an action for a specific trigger ID, range of IDs, or all wireless-trigger IDs.

**Syntax** `wireless wireless-trigger [all|<trigger-id>] activate`  
`wireless wireless-trigger [all|<trigger-id>] deactivate`

| Parameter    | Description   |
|--------------|---|
| all          | Action all wireless-triggers.   |
| <trigger-id> | The trigger ID. This can be a number in the range of 1-8. You can also specify multiple trigger IDs using a comma separated list. |
| activate     | Activate wireless-trigger.  |
| deactivate   | Deactivate wireless-trigger.  |

**Default** Not set.

**Mode** Privileged Exec

**Example** To activate wireless-trigger 1, use the command:

```
awplus# wireless wireless-trigger 1 activate
```

To deactivate all wireless-triggers, use the command:

```
awplus# wireless wireless-trigger all deactivate
```

**Related commands** [show wireless wireless-trigger](#)  
[wireless-trigger](#)  
[description \(wireless-trigger\)](#)  
[show wireless network](#)

**Command changes** Version 5.5.1-0.1: command added

# wireless-trigger

**Overview** Use this command to add a wireless trigger and enter the wireless-trigger configuration mode.

Use the **no** variant of this command to delete a specific wireless-trigger ID configuration.

**Syntax** `wireless-trigger <trigger-id>`  
`no wireless-trigger <trigger-id>`

| Parameter                       | Description                          |
|---------------------------------|--------------------------------------|
| <code>&lt;trigger-id&gt;</code> | Enter an ID number in the range 1-8. |

**Default** Not set

**Mode** Wireless Configuration

**Example** To add a wireless trigger and enter the wireless-trigger configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# wireless-trigger 1
awplus(config-wireless-trigger)#
```

To delete a wireless trigger, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# no wireless-trigger 1
```

**Command changes** Version 5.5.1-0.1: command added

# wireless-trigger-id

**Overview** Use this command to mark a network for a wireless-trigger.  
Use the **no** variant of this command to unmark a wireless trigger on a network.

**Syntax** `wireless-trigger-id <trigger-id>`  
`no wireless-trigger-id <trigger-id>`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;trigger-id&gt;</code> | Trigger ID, a numerical value in the range 1-8. The trigger must already exist. |

**Default** Not set.

**Mode** Wireless Network Configuration

**Example** To mark a wireless trigger in network 5, use the commands:

```
awplus# configure terminal
awplus(config)# wireless
awplus(config-wireless)# network 5
awplus(config-wireless-network)# wireless-trigger-id 1
```

# 62

# Device Discovery using SNMP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure Device Discovery using SNMP.

SNMP Device Discovery is available from the AlliedWare Plus CLI and is also available from Vista Manager mini. This feature provides information that allows the CLI to display third party vendor device data in real time.

For more information, see the [Device Discovery and Monitoring using SNMP Feature Overview and Configuration Guide](#).

- Command List**
- [“clear snmp-discovery”](#) on page 3603
  - [“service snmp-discovery”](#) on page 3604
  - [“show running-config snmp-discovery”](#) on page 3605
  - [“show snmp-discovery”](#) on page 3606
  - [“snmp-discovery arp-polling-interval”](#) on page 3609
  - [“snmp-discovery community”](#) on page 3610
  - [“snmp-discovery deny”](#) on page 3611
  - [“snmp-discovery permit”](#) on page 3613
  - [“snmp-discovery snmp-polling-interval”](#) on page 3614
  - [“snmp-discovery snmp-version”](#) on page 3615
  - [“snmp-discovery user”](#) on page 3616

# clear snmp-discovery

**Overview** Use this command to remove information learned by the SNMP Discovery process.

**Syntax** `clear snmp-discovery ip [<ipv4-address>]`  
`clear snmp-discovery nodes [<ipv4-address>]`

| Parameter      | Description   |
|----------------|---|
| ip             | Internet Protocol (IP)  |
| <ipv4-address> | IPv4 network address for the discovered device, for example 192.168.3.1 |
| nodes          | Node information  |
| <ipv4-address> | IPv4 network address for the discovered nodes, for example 192.168.3.1  |

**Default** No information is cleared.

**Mode** Privileged Exec

**Examples** To remove all SNMP discovered devices, use the command:

```
node1# clear snmp-discovery nodes
```

To remove a particular SNMP discovered device, use the command:

```
node1# clear snmp-discovery nodes 192.168.3.1
```

To remove all entries from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip
```

To remove a particular entry from SNMP Discovery's database of devices discovered by ARP, use the command:

```
node1# clear snmp-discovery ip 192.168.3.1
```

**Related commands** [show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# service snmp-discovery

**Overview** Use this command to enable SNMP Discovery to discover devices on an AMF network.

Use the **no** variant of this command to disable SNMP Discovery.

**Syntax** `service snmp-discovery`  
`no service snmp-discovery`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** The server starts a process which detects IP addresses reachable on a network. An SNMP 'get' request is performed on these IP addresses to detect device information. The SNMP name, SNMP description, SNMP location, and SNMP serial number are obtained if they are available.

SNMP Discovery will not run if there are no Layer 3 IP interfaces configured.

**Example** To start the discovery service on the AMF node, use the commands:

```
awplus# configure terminal
awplus(config)# service snmp-discovery
```

**Related commands** [show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# show running-config snmp-discovery

**Overview** Use this command to display the running configuration for SNMP Discovery.

**Syntax** `show running-config snmp-discovery`

**Mode** Privileged Exec

**Example** To display the running configuration for SNMP Discovery, use the command:

```
awplus# show running-config snmp-discovery
```

**Output** Figure 62-1: Example output from **show running-config snmp-discovery**

```
node1#show running-config snmp-discovery

snmp-discovery permit ip 192.168.3.2
snmp-discovery permit ip 192.168.3.6
snmp-discovery deny ip 192.168.3.5
```

**Related commands** [show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# show snmp-discovery

**Overview** Use this command to show information about the SNMP Discovery process.

**Syntax** `show snmp-discovery [detail|ip|nodes]`

| Parameter | Description                     |
|-----------|---------------------------------|
| detail    | SNMP Discovery node detail      |
| ip        | SNMP Discovery IP addresses     |
| nodes     | SNMP Discovery node information |

**Mode** User Exec

**Examples** To display information about the SNMP Discovery status, use the command:

```
awplus# show snmp-discovery
```

To display information about the SNMP Discovery IPv4 addresses learned, use the command:

```
awplus# show snmp-discovery ip
```

To display information about the SNMP Discovery nodes learned, use the command:

```
awplus# show snmp-discovery nodes
```

To display information about the SNMP Discovery in greater detail, use the command:

```
awplus# show snmp-discovery detail
```

**Output** Figure 62-2: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery

# snmp-discovery arp-polling-interval

**Overview** Use this command to configure the SNMP ARP polling interval.

Use the **no** variant of this command to set the SNMP ARP polling interval back to the default (60 seconds).

**Syntax** `snmp-discovery arp-polling-interval <1-3600>`  
`no snmp-discovery arp-polling-interval`

| Parameter                   | Description  |
|-----------------------------|--|
| <code>&lt;1-3600&gt;</code> | The polling number in seconds to interval in the range from 1 to 3600. |

**Default** ARP requests are sent out every 60 seconds

**Mode** Global Configuration

**Usage notes** SNMP Discovery first uses ARP to discover subnets that are reachable from the AMF node. This polling happens every 60 seconds by default. Use this command to change the polling interval.

**Examples** To configure the SNMP Discovery ARP polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery arp-polling-interval 120
```

To set the SNMP Discovery ARP polling interval back to the default (60 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery arp-polling-interval
```

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery community

**Overview** Use this command to create an SNMP community in read-only mode for SNMPv1 and v2c only.

Use the **no** variant of this command to remove an SNMP community.

**Syntax** `snmp-discovery community <community-name>`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;community-name&gt;</code> | The name of the community that can be up to 20 characters long and is case sensitive. |

**Default** The SNMP Discovery community name is 'public' by default

**Mode** Global Configuration

**Usage notes** This command creates an SNMP community in read-only mode. The community allows access to all MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used for SNMPv3.

**Examples** To configure an SNMP community named 'accounting', use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery community accounting
```

To set the SNMP community name back to the default (public), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery community
```

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery deny

**Overview** Use this command to prevent ARP requests from being sent. When an interface or IPv4 address is denied, it means an ARP request and SNMP 'get' request will never be sent to that device when the command **service snmp-discovery** is enabled.

Use the **no** variant of this command to remove the configuration.

**Syntax**

```
snmp-discovery deny interface <interface-range>  
snmp-discovery deny ip <ipv4-address>  
no snmp-discovery deny interface <interface-range>  
no snmp-discovery deny ip <ipv4-address>
```

| Parameter        | Description                       |
|------------------|-----------------------------------|
| interface        | Interfaces to deny                |
| <interface-name> | Interface name, for example VLAN2 |
| ip               | IP address                        |
| <ipv4-address>   | IPv4 address to deny              |

**Default** AMF and stacking management VLANs are denied

**Mode** Global Configuration

**Examples** To configure a deny interface command for VLAN2, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-discovery deny interface vlan2
```

To stop interface VLAN2 from being denied, use the commands:

```
awplus# configure terminal  
awplus(config)# no snmp-discovery deny interface vlan2
```

To configure a deny IP command for IP address 192.168.3.2, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-discovery deny ip 192.168.3.2
```

To stop IP address 192.168.3.2 from being denied, use the commands:

```
awplus# configure terminal  
awplus(config)# no snmp-discovery deny ip 192.168.3.2
```

**Output** Figure 62-6: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip
SNMP Discovery Devices:
```

| IP Address  | MAC Address    | Type    | State | Last Seen Time        |
|-------------|----------------|---------|-------|-----------------------|
| 192.168.3.2 | -              | Deny    | -     | -                     |
| 1.2.3.6     | -              | Permit  | -     | 30 Jul, 2020 06:30:55 |
| 1.2.3.4     | -              | Permit  | -     | 31 Jul, 2020 05:49:04 |
| 192.168.2.2 | 3863.bb5c.b900 | Dynamic | Up    | -                     |

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery permit

**Overview** Use this command if you want to allow SNMP Discovery to do requests on interfaces with greater than 256 members. You can permit a specific IP address.

**Syntax** `snmp-discovery permit ip <ipv4-address>`  
`no snmp-discovery permit ip <ipv4-address>`

| Parameter      | Description            |
|----------------|------------------------|
| ip             | Internet Protocol (IP) |
| <ipv4-address> | IPv4 network address   |

**Default** All IPv4 interfaces with 256 members or less are included in SNMP Discovery.

**Mode** Global Configuration

**Examples** To configure a permit IP command for the address 192.168.3.2, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-discovery permit ip 192.168.3.2
```

To remove the permit configuration for the address 192.168.3.2, use the commands:

```
awplus# configure terminal  
awplus(config)# no snmp-discovery permit ip 192.168.3.2
```

**Output** Figure 62-7: Example output from **show snmp-discovery ip**

```
awplus#show snmp-discovery ip  
SNMP Discovery Devices:
```

| IP Address  | MAC Address    | Type    | State | Last Seen Time        |
|-------------|----------------|---------|-------|-----------------------|
| 1.2.3.5     | -              | Deny    | -     | -                     |
| 1.2.3.6     | -              | Permit  | -     | Jul 27, 2020 03:33:39 |
| 1.2.3.4     | -              | Permit  | -     | Jul 28, 2020 04:25:05 |
| 192.168.2.2 | 3863.bb5c.b900 | Dynamic | Up    | -                     |
| 192.168.3.2 | 4263.cc3c.b500 | permit  | Up    | -                     |

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery snmp-polling-interval

**Overview** Use this command to change the SNMP request polling interval (in seconds).  
Use the **no** variant of this command to set the SNMP request polling interval back to the default (300 seconds).

**Syntax** `snmp-discovery snmp-polling-interval <60-3600>`  
`no snmp-discovery snmp-polling-interval`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;60-3600&gt;</code> | The number of seconds for the SNMP polling interval. From the range 60 to 3600. |

**Default** 300 seconds (5 minutes)

**Mode** Global Configuration

**Usage notes** ARP polling and SNMP Discovery uses SNMP 'get' requests to poll the devices discovered by the ARP polling. This polling happens every 300 seconds (5 minutes) by default.

SNMP polling is enabled when **service snmp-discovery** is enabled.

**Examples** To configure the SNMP discovery polling interval to 120 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery snmp-polling-interval 120
```

To set the SNMP discovery polling interval back to the default (300 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery snmp-polling-interval
```

**Related commands** [service snmp-discovery](#)  
[show snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery snmp-version

**Overview** Use this command to set the SNMP version that you are using.  
Use the **no** variant of this command to set the SNMP version back to the default (v2c).

**Syntax** `snmp-discovery snmp-version {v1|v2c|v3}`  
`no snmp-discovery snmp-version`

| Parameter | Description  |
|-----------|--|
| v1        | Enter the SNMP version number you are using  |
| v2c       | If you are using SNMP version v2c, set the community name with the command <b>snmp-discovery community</b> |
| v3        | If you are using SNMP version v3, set the security with the command <b>snmp-discovery user</b>             |

**Default** SNMP version v2c

**Mode** Global Configuration

**Usage notes** This command defaults to SNMP version v2c and creates an SNMP community in read-only mode. The community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

If using SNMPv3, you can choose the security level and then the authentication protocol and privacy protocol.

**Examples** To configure SNMP Discovery to use SNMP version 3, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-discovery snmp-version v3
```

To set the SNMP Discovery SNMP version back to the default (v2c), use the commands:

```
awplus# configure terminal  
awplus(config)# no snmp-discovery snmp-version
```

**Related commands** [service snmp-discovery](#)

**Command changes** Version 5.5.0-0.3: command added

# snmp-discovery user

**Overview** Use this command to create a user for SNMPv3 'get' requests only.

Use the **no** variant of this command to remove an SNMPv3 user.

**Syntax** `snmp-discovery user <user-name> [encrypted] [auth {md5|sha} <auth-password>] [priv {des|aes} <privacy-password>]`  
`no snmp-discovery user <user-name>`

| Parameter          | Description  |
|--------------------|--|
| <user-name>        | The user name is a string up to 20 characters long and is case sensitive. For example, 'Rodger'. |
| encrypted          | Use the encrypted parameter when you want to enter encrypted passwords.                          |
| auth               | Authentication protocol that can be either MD5 or SHA.   |
| md5                | MD5 Message Digest Algorithms.   |
| sha                | SHA Secure Hash Algorithm.   |
| <auth-password>    | Authentication password that is a string from 8 to 20 characters and is case sensitive.          |
| priv               | Privacy protocol that can be either DES or AES.  |
| des                | DES Data Encryption Standard.  |
| aes                | AES Advanced Encryption Standards.   |
| <privacy-password> | Privacy password is a string from 8 to 20 characters and is case sensitive.                      |

**Default** No user is configured

**Mode** Global Configuration

**Usage notes** Additionally, this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

The authentication method must match what is used on the devices being configured.

Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configurations stored on the switch.

User passwords are entered using plain text without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.

User passwords are viewed as encrypted passwords in running and startup configurations shown from the **show running-config** and **show startup-config**

commands. Copy and paste encrypted passwords from the running configuration or startup configuration to avoid entry errors.

**Examples** To add SNMP Discovery user 'authuser' with authentication protocol 'md5', authentication password 'authpass' privacy protocol 'des' and privacy password privpass, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser auth md5 Authpass
priv des Privpass
```

To enter existing SNMP user 'authuser' with existing passwords with authentication protocol 'md5' plus the encrypted authentication password '0x1c74b9c22118291b0ce0cd883f8dab6b74', privacy protocol 'des' plus the encrypted privacy password '0x0e0133db5453ebd03822b004eeacb6608f', use the following commands:

*Note Copy and paste the encrypted passwords from the running-config or the startup-config displayed, using the show running-config and show startup-config commands respectively, into the command line to avoid key stroke errors issuing this command.*

```
awplus# configure terminal
awplus(config)# snmp-discovery user authuser encrypted auth
md50x1c74b9c22118291b0ce0cd883f8dab6b74 priv des
0x0e0133db5453ebd03822b004eeacb6608f
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-discovery user authuser
```

**Output** Figure 62-8: Example output from **show snmp-discovery**

```
awplus#show snmp-discovery
SNMP Discovery information:

SNMP Discovery                : Enabled

# bootfile

**Overview** This command sets the boot filename for a DHCP server pool. This is the name of the boot file that the client should use in its bootstrap process. It may need to include a path.

The **no** variant of this command removes the boot filename from a DHCP server pool.

**Syntax** `bootfile <filename>`  
`no bootfile`

| Parameter                     | Description         |
|-------------------------------|---------------------|
| <code>&lt;filename&gt;</code> | The boot file name. |

**Mode** DHCP Configuration

**Example** To configure the boot filename for a pool P2, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# bootfile boot/main_boot.bt
```

# clear ip dhcp binding

**Overview** This command clears either a specific lease binding or the lease bindings specified by the command or DHCP server. The command will only take effect on dynamically allocated bindings, not statically configured bindings.

**Syntax** `clear ip dhcp binding {ip <ip-address>|mac <mac-address>|all|pool <pool-name>|range <low-ip-address> <high-ip-address>}`

**Syntax (VRF-lite)** `clear ip dhcp binding [vrf <name>|global] {ip <ip-address>|mac <mac-address>|all|pool <pool-name>|range <low-ip-address> <high-ip-address>}`

| Parameter                                | Description  |
|--|--|
| vrf                                      | Display the output for a VRF instance  |
| <name>                                   | The name of the specific VRF instance.   |
| global                                   | Display the output for the Global VRF instance   |
| ip <ip-address>                          | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D.   |
| mac <mac-address>                        | MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH.  |
| all                                      | All DHCP bindings.   |
| pool <pool-name>                         | Description used to identify DHCP server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks". |
| range <low-ip-address> <high-ip-address> | IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end of the range.             |

**Mode** User Exec and Privileged Exec

**Usage** A specific binding may be deleted by **ip** address or **mac** address, or several bindings may be deleted at once using **all**, **pool** or **range**.

Note that if you specify to clear the **ip** or **mac** address of what is actually a static DHCP binding, an error message is displayed. If **all**, **pool** or **range** are specified and one or more static DHCP bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

**Examples** To clear the specific IP address binding 192.168.1.1, use the command:

```
awplus# clear ip dhcp binding ip 192.168.1.1
```

To clear all dynamic DHCP entries, use the command:

```
awplus# clear ip dhcp binding all
```

**Example (VRF-lite)** To clear all dynamic binding from VRF red instance, use the command:

```
awplus# clear ip dhcp binding vrf red all
```

**Related commands** [show ip dhcp binding](#)

# default-router

**Overview** This command adds a default router to the DHCP address pool you are configuring. You can use this command multiple times to create a list of default routers on the client's subnet. This sets the router details using the pre-defined option 3. Note that if you add a user-defined option 3 using the **option** command, then you will override any settings created with this command.

The **no** variant of this command removes either the specified default router, or all default routers from the DHCP pool.

**Syntax** `default-router <ip-address>`  
`no default-router [<ip-address>]`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;ip-address&gt;</code> | IPv4 address of the default router, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To add a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# default-router 192.168.1.2
```

To remove a router with an IP address 192.168.1.2 to the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router 192.168.1.2
```

To remove all routers from the DHCP pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no default-router
```

# dns-server

**Overview** This command adds a Domain Name System (DNS) server to the DHCP address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6.

The **no** variant of this command removes either the specified DNS server, or all DNS servers from the DHCP pool.

**Syntax** `dns-server <ip-address>`  
`no dns-server [<ip-address>]`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;ip-address&gt;</code> | IPv4 address of the DNS server, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To add the DNS server with the assigned IP address 192.168.1.1 to the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# dns-server 192.168.1.1
```

To remove the DNS server with the assigned IP address 192.168.1.1 from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server 192.168.1.1
```

To remove all DNS servers from the DHCP pool named P1, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no dns-server
```

**Related commands** [default-router](#)  
[show ip dhcp pool](#)  
[subnet-mask](#)

# domain-name

**Overview** This command adds a domain name to the DHCP address pool you are configuring. Use this command to specify the domain name that a client should use when resolving host names using the Domain Name System. This sets the domain name details using the pre-defined option 15.

Note that if you add a user-defined option 15 using the [option](#) command, then you will override any settings created with this command.

The **no** variant of this command removes the domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;domain-name&gt;</code> | The domain name you wish to assign the DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** DHCP Configuration

**Examples** To add the domain name `Nerv_Office` to DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# domain-name Nerv_Office
```

To remove the domain name `Nerv_Office` from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no domain-name Nerv_Office
```

# host (DHCP)

**Overview** This command adds a static host address to the DHCP address pool you are configuring. The client with the matching MAC address is permanently assigned this IP address. No other clients can request it.

The **no** variant of this command removes the specified host address from the DHCP pool. Use the **no host all** command to remove all static host addresses from the DHCP pool.

**Syntax** `host <ip-address> <mac-address>`  
`no host <ip-address>`  
`no host all`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;ip-address&gt;</code>  | IPv4 address of the DHCP client, in dotted decimal notation in the format A.B.C.D    |
| <code>&lt;mac-address&gt;</code> | MAC address of the DHCP client, in hexadecimal notation in the format HHHH.HHHH.HHHH |

**Mode** DHCP Configuration

**Usage** Note that a network/mask must be configured using a **network** command before issuing a **host** command. Also note that a host address must match a network to add a static host address.

**Examples** To add the host at 192.168.1.5 with the MAC address 000a.451d.6e34 to DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# network 192.168.1.0/24
awplus(dhcp-config)# host 192.168.1.5 000a.451d.6e34
```

To remove the host at 192.168.1.5 with the MAC address 000a.451d.6e34 from DHCP pool 1, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool 1
awplus(dhcp-config)# no host 192.168.1.5 000a.451d.6e34
```

**Related  
Commands** [lease](#)  
[range](#)

[show ip dhcp pool](#)

# ip address dhcp

**Overview** This command activates the DHCP client on the interface you are configuring. This allows the interface to use the DHCP client to obtain its IP configuration details from a DHCP server on its connected network.

The **client-id** and **hostname** parameters are identifiers that you may want to set in order to interoperate with your existing DHCP infrastructure. If neither option is needed, then the DHCP server uses the MAC address field of the request to identify the host.

The DHCP client supports the following IP configuration options:

- Option 1— the subnet mask for your device.
- Option 3— a list of default routers.
- Option 6 — a list of DNS servers. This list appends the DNS servers set on your device with the [ip name-server](#) command.
- Option 15—a domain name used to resolve host names. This option replaces the domain name set with the [ip domain-name](#) command. Your device ignores this domain name if it has a domain list set using the [ip domain-list](#) command.
- Option 51—lease expiration time.

The **no** variant of this command stops the interface from obtaining IP configuration details from a DHCP server.

**Syntax** `ip address dhcp [client-id <interface>] [hostname <hostname>]`  
`no ip address dhcp`

| Parameter  | Description  |
|--|--|
| <code>client-id</code><br><code>&lt;interface&gt;</code> | The name of the interface you are activating the DHCP client on. If you specify this, then the MAC address associated with the specified interface is sent to the DHCP server in the optional identifier field.<br>Default: no default |
| <code>hostname</code><br><code>&lt;hostname&gt;</code>   | The hostname for the DHCP client on this interface. Typically this name is provided by the ISP.<br>Default: no default   |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To set the interface `vlan2` to use DHCP to obtain an IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip address dhcp
```

To stop the interface vlan2 from using DHCP to obtain its IP address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip address dhcp
```

**Related commands**

- [ip address \(IP Addressing and Protocol\)](#)
- [show ip interface](#)
- [show running-config](#)

# ip dhcp bootp ignore

**Overview** This command configures the DHCP server to ignore any BOOTP requests it receives. The DHCP server accepts BOOTP requests by default.

The **no** variant of this command configures the DHCP server to accept BOOTP requests. This is the default setting.

**Syntax** `ip dhcp bootp ignore`  
`no ip dhcp bootp ignore`

**Mode** Global Configuration

**Examples** To configure the DHCP server to ignore BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp bootp ignore
```

To configure the DHCP server to respond to BOOTP requests, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp bootp ignore
```

**Related commands** [show ip dhcp server summary](#)

# ip dhcp leasequery enable

**Overview** Use this command to enable the DHCP server to respond to DHCPLEASEQUERY packets. Enabling the DHCP leasequery feature allows a DHCP Relay Agent to obtain IP address information directly from the DHCP server using DHCPLEASEQUERY messages.

Use the **no** variant of this command to disable the support of DHCPLEASEQUERY packets.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** ip dhcp leasequery enable  
no ip dhcp leasequery enable

**Default** DHCP leasequery support is disabled by default.

**Mode** Global Configuration

**Examples** To enable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp leasequery enable
```

To disable DHCP leasequery support, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp leasequery enable
```

**Related commands** [show counter dhcp-server](#)  
[show ip dhcp server statistics](#)  
[show ip dhcp server summary](#)

# ip dhcp option

**Overview** This command creates a user-defined DHCP option. Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

You can use this option when configuring a DHCP pool, by using the [option](#) command.

The **no** variant of this command removes either the specified user-defined option, or removes all user-defined options. This also automatically removes the user-defined options from the associated DHCP address pools.

**Syntax** `ip dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ip dhcp option [<1-254>|<option-name>]`

| Parameter     | Description  |       |                      |     |   |    |   |         |                                |      |   |
|---------------|--|-------|----------------------|-----|---|----|---|---------|--------------------------------|------|---|
| <1-254>       | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.   |       |                      |     |   |    |   |         |                                |      |   |
| <option-name> | Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".<br>Default: no default   |       |                      |     |   |    |   |         |                                |      |   |
| <option-type> | The option value. You must specify a value that is appropriate to the option type: <table border="1"><tbody><tr><td>ascii</td><td>An ASCII text string</td></tr><tr><td>hex</td><td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td></tr><tr><td>ip</td><td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.</td></tr><tr><td>integer</td><td>A number from 0 to 4294967295.</td></tr><tr><td>flag</td><td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td></tr></tbody></table> | ascii | An ASCII text string | hex | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. | ip | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times. | integer | A number from 0 to 4294967295. | flag | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag. |
| ascii         | An ASCII text string   |       |                      |     |   |    |   |         |                                |      |   |
| hex           | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.  |       |                      |     |   |    |   |         |                                |      |   |
| ip            | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually by using the option command multiple times.  |       |                      |     |   |    |   |         |                                |      |   |
| integer       | A number from 0 to 4294967295.   |       |                      |     |   |    |   |         |                                |      |   |
| flag          | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.  |       |                      |     |   |    |   |         |                                |      |   |

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name `tcpip-node-type`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name `special-address`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option 12
```

To remove the specific user-defined option with the option name `perform-router-discovery`, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option perform-router-discovery
```

To remove all user-defined option definitions, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp option
```

# ip dhcp pool

**Overview** This command will enter the configuration mode for the pool name specified. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCP configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCP pools on devices with multiple interfaces. This allows the device to act as a DHCP server on multiple interfaces to distribute different information to clients on the different networks.

The **no** variant of this command deletes the specific DHCP pool.

**Syntax** `ip dhcp pool <pool-name>`  
`no ip dhcp pool <pool-name>`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;pool-name&gt;</code> | Description used to identify this DHCP pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Global Configuration

**Example** To create the DHCP pool named P2 and enter DHCP Configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)#
```

To delete the DHCP pool named P2, use the commands:

```
awplus# configure terminal
awplus(config)# no ip dhcp pool P2
```

**Related commands** [service dhcp-server](#)

# ip dhcp-client default-route distance

**Overview** Use this command to specify an alternative Administrative Distance (AD) for the current default route (from DHCP) for an interface.

Use the **no** variant of this command to set the AD back to the default of 1.

**Syntax** `ip dhcp-client default-route distance [<1-255>]`  
`no ip dhcp-client default-route distance`

| Parameter | Description   |
|-----------|---|
| <1-255>   | Administrative Distance (AD) from the range 1 though 255. |

**Default** 1

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** DHCP client interfaces can automatically add a default route with an AD of 1 into the IP Routing Information Base (RIB).

Any pre-existing default route(s) via alternative interfaces (configured with a higher AD) will no longer be selected as the preferred forwarding path for traffic when the DHCP based default route is added to the IP routing table.

This can be problematic if the DHCP client is operating via an interface that is only intended to be used for back-up interface redundancy purposes, such as an interface with lower bandwidth or a particular role like the management interface.

Use this command to set the AD of the default route (via a specific DHCP client interface) to a non-default (higher cost) value, ensuring any pre-existing default route(s) via any other interface(s) continue to be selected as the preferred forwarding path for network traffic.

When the command is used, the static default route is deleted from the RIB, the distance value of the route is modified to the configured distance value, then it is reinstalled into the RIB.

**Examples** To configure vlan10 as a DHCP client and to set the AD for the default route added by DHCP to 150, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# ip address dhcp
awplus(config-if)# ip dhcp-client default-route distance 150
```

To set the AD for the default route back to the default value of 1, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-client default-route distance
```

**Related  
commands**

[show ip route database](#)

**Command  
changes**

Version 5.4.7-0.2 Command added.

# ip dhcp-client request vendor-identifying-specific

**Overview** Use this command to add vendor-identifying vendor-specific information (option 125) requests to the DHCP discovery packets sent by an interface. This option, along with option 124, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-specific request from an interface.

**Syntax** `ip dhcp-client request vendor-identifying-specific`  
`no ip dhcp-client request vendor-identifying-specific`

**Default** The vendor-identifying-specific request is not configured by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To add the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-client request
vendor-identifying-specific
```

To remove the vendor-identifying-specific request on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client request
vendor-identifying-specific
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client vendor-identifying-class](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-client vendor-identifying-class

**Overview** Use this command to add a vendor-identifying vendor class (option 124) to the DHCP discovery packets sent by an interface. This option places the Allied Telesis Enterprise number (207) into the discovery packet. Option 124, along with option 125, can be used to send vendor-specific information back to a DHCP client.

See RFC3925 for more information on Vendor-Identifying Vendor Options for DHCPv4.

Use the **no** variant of this command to remove the vendor-identifying-class from an interface.

**Syntax** `ip dhcp-client vendor-identifying-class`  
`no ip dhcp-client vendor-identifying-class`

**Default** The vendor-identifying-class is not configured by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The DHCP client must be activated on the interface, using the [ip address dhcp](#) command, so that DHCP discovery packets are sent.

**Example** To remove the vendor-identifying-class on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-client vendor-identifying-class
```

**Related commands** [ip address dhcp](#)  
[ip dhcp-client request vendor-identifying-specific](#)

**Command changes** Version 5.4.7-2.1: command added

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands `ip dhcp-relay agent-option` and `ip dhcp-relay information policy` have been configured.*

**Syntax**

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

This command cannot be enabled if DHCP snooping is enabled on your device ([service dhcp-snooping](#) command), and vice versa.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands**

- [ip dhcp-relay agent-option remote-id](#)
- [ip dhcp-relay information policy](#)
- [ip dhcp-relay max-message-length](#)
- [service dhcp-relay](#)

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option remote-id](#)  
[ip dhcp-relay information policy](#)  
[service dhcp-relay](#)

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay agent-option remote-id <remote-id>  
no ip dhcp-relay agent-option remote-id
```

| Parameter   | Description  |
|-------------|--|
| <remote-id> | An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed. |

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface vlan2  
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface vlan2  
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [show ip dhcp-relay](#)

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax**

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

| Parameter | Description  |
|-----------|--|
| append    | The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.                               |
| drop      | The DHCP Relay Agent discards the packet.  |
| keep      | The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.  |
| replace   | The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet. |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-255>   | The maximum hop count value. |

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for VLAN interfaces.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

| Parameter  | Description   |
|------------|---|
| <548-1472> | The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes). |

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay
```

| Parameter          | Description   |
|--------------------|---|
| <ipv4-address>     | Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D. |
| <ipv6-address>     | Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.  |
| <server-interface> | Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.  |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples: DHCP for IPv4** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

**Examples: DHCPv6** To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

**Example: disabling DHCP relay** To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay use-client-side-address

**Overview** Use this command to configure DHCP-Relay to use the client-side interface (that is the interface receiving the DHCP client packets) IP address as the source address of the relayed DHCP packets.

Use the **no** variant of this command to disable the use of the client-side interface IP address as the source IP address for relayed DHCP packets.

**Syntax** `ip dhcp-relay use-client-side-address`  
`no ip dhcp-relay use-client-side-address`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>use-client-side-address</code> | Use the client side interface IP address as the source IP address for relayed DHCP packets. |

**Default** By default, the server-side interface IP address is used as the source IP address of DHCP relayed packets.

**Mode** Global Configuration

**Usage notes** In most cases, there are filters placed between the DHCP relay and DHCP server which only allow DHCP packets from the client subnet to the server and back. This command allows you to configure the DHCP relay so that the relay will use the IP address of the interface **receiving** clients' DHCP requests to be used as the source IP address of the relayed DHCP packets.

**Example** To configure the client-side IP address as the source IP address of DHCP relayed packets, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp-relay use-client-side-address
```

**Output** Figure 63-1: Example output from **show ip dhcp-relay**

The second line of the display output shows the status of the client-side address being enabled as the source IP address.

```
awplus#sh ip dhcp-relay
DHCP Relay Service is enabled
Use of client side address as source address is enabled
...
```

**Related commands** [ip dhcp-relay server-address](#)

**Command changes** Version 5.4.9-0.7: command added

# lease

**Overview** This command sets the expiration time for a leased address for the DHCP address pool you are configuring. The time set by the days, hours, minutes and seconds is cumulative. The minimum total lease time that can be configured is 20 seconds. The maximum total lease time that can be configured is 120 days.

Note that if you add a user-defined option 51 using the `option` command, then you will override any settings created with this command. Option 51 specifies a lease time of 1 day.

Use the **infinite** parameter to set the lease expiry time to infinite (leases never expire).

Use the **no** variant of this command to return the lease expiration time back to the default of one day.

**Syntax** `lease <days> <hours> <minutes> [<seconds>]`  
`lease infinite`  
`no lease`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;days&gt;</code>    | The number of days, from 0 to 120, that the lease expiry time is configured for.<br>Default: 1 |
| <code>&lt;hours&gt;</code>   | The number of hours, from 0 to 24, that the lease expiry time is configured for.<br>Default: 0 |
| <code>&lt;minutes&gt;</code> | The number of minutes, from 0 to 60, the lease expiry time is configured for.<br>Default: 0    |
| <code>&lt;seconds&gt;</code> | The number of seconds, from 0 to 60, the lease expiry time is configured for.                  |
| <code>infinite</code>        | The lease never expires.   |

**Default** The default lease time is 1 day.

**Mode** DHCP Configuration

**Examples** To set the lease expiration time for address pool P2 to 35 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# lease 0 0 35
```

To set the lease expiration time for the address pool `Nerv_Office` to 1 day, 5 hours, and 30 minutes, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# lease 1 5 30
```

To set the lease expiration time for the address pool `P3` to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P3
awplus(dhcp-config)# lease 0 0 0 20
```

To set the lease expiration time for the pool to never expire, use the command:

```
awplus(dhcp-config)# lease infinite
```

To return the lease expiration time to the default of one day, use the command:

```
awplus(dhcp-config)# no lease
```

**Related  
commands**

[option](#)  
[service dhcp-server](#)  
[short-lease-threshold](#)

# network (DHCP)

**Overview** This command sets the network (subnet) that the DHCP address pool applies to. The **no** variant of this command removes the network (subnet) from the DHCP address pool.

**Syntax**

```
network  
{<ip-subnet-address/prefix-length>|<ip-subnet-address/mask>}  
no network
```

| Parameter                                      | Description  |
|--|--|
| <i>&lt;ip-subnet-address/prefix-length&gt;</i> | The IPv4 subnet address in dotted decimal notation followed by the prefix length in slash notation.        |
| <i>&lt;ip-subnet-address/mask&gt;</i>          | The IPv4 subnet address in dotted decimal notation followed by the subnet mask in dotted decimal notation. |

**Mode** DHCP Configuration

**Usage notes** This command will fail if it would make existing ranges invalid. For example, if they do not lie within the new network you are configuring.

The **no** variant of this command will fail if ranges still exist in the pool. You must remove all ranges in the pool before issuing a **no network** command to remove a network from the pool.

**Examples** To configure a network for the address pool P2, where the subnet is 192.0.2.5 and the mask is 255.255.255.0, use the commands:

```
awplus# configure terminal  
awplus(config)# ip dhcp pool P2  
awplus(dhcp-config)# network 192.0.2.5/24
```

or you can use dotted decimal notation instead of slash notation for the subnet-mask:

```
awplus# configure terminal  
awplus(config)# ip dhcp pool P2  
awplus(dhcp-config)# network 192.0.2.5 255.255.255.0
```

**Related commands** [service dhcp-server](#)  
[subnet-mask](#)

## next-server

**Overview** This command sets the next server address for a DHCP server pool. It is the address of the next server that the client should use in its bootstrap process.

The **no** variant of this command removes the next server address from the DHCP address pool.

**Syntax** `next-server <ip-address>`  
`no next-server`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | The server IP address, entered in dotted decimal notation. |

**Mode** DHCP Configuration

**Example** To set the next-server address for the address pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# next-server 192.0.2.2
```

# option

**Overview** This command adds a user-defined option to the DHCP address pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value. Options with an **ip** type can hold a list of IP addresses or masks (i.e. entries that have the A.B.C.D address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IP addresses.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

The **no** variant of this command removes the specified user-defined option from the DHCP pool, or all user-defined options from the DHCP pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

| Parameter      | Description   |     |   |    |  |         |                                |      |  |
|----------------|---|-----|---|----|--|---------|--------------------------------|------|--|
| <1-254>        | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.  |     |   |    |  |         |                                |      |  |
| <option-name>  | Option name associated with the option.   |     |   |    |  |         |                                |      |  |
| <option-value> | The option value. You must specify a value that is appropriate to the option type: <table border="1" data-bbox="710 1261 1423 1751"> <tbody> <tr> <td>hex</td> <td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td> </tr> <tr> <td>ip</td> <td>An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.</td> </tr> <tr> <td>integer</td> <td>A number from 0 to 4294967295.</td> </tr> <tr> <td>flag</td> <td>A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.</td> </tr> </tbody> </table> | hex | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. | ip | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times. | integer | A number from 0 to 4294967295. | flag | A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag. |
| hex            | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.   |     |   |    |  |         |                                |      |  |
| ip             | An IPv4 address or mask that has the dotted decimal A.B.C.D notation. To create a list of IP addresses, you must add each IP address individually using the option command multiple times.  |     |   |    |  |         |                                |      |  |
| integer        | A number from 0 to 4294967295.  |     |   |    |  |         |                                |      |  |
| flag           | A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.  |     |   |    |  |         |                                |      |  |

**Mode** DHCP Configuration

**Examples** To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the command:

```
awplus(dhcp-config)# option 175 192.0.2.6
awplus(dhcp-config)# option 175 192.0.2.12
awplus(dhcp-config)# option 175 192.0.2.33
```

To add the option 179 to a pool, and give the option the value `123456`, use the command:

```
awplus(dhcp-config)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the command:

```
awplus(dhcp-config)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the command:

```
awplus(dhcp-config)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the command:

```
awplus(dhcp-config)# no option tftp-server-name
```

[service dhcp-server](#)

[show ip dhcp pool](#)

# probe enable

**Overview** Use this command to enable lease probing for a DHCP pool. Probing is used by the DHCP server to check if an IP address it wants to lease to a client is already being used by another host.

The **no** variant of this command disables probing for a DHCP pool.

**Syntax** `probe enable`  
`no probe enable`

**Default** Probing is enabled by default.

**Mode** DHCP Pool Configuration

**Examples** To enable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe enable
```

To disable probing for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe enable
```

**Related commands** [probe packets](#)  
[probe timeout](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe packets

**Overview** Use this command to specify the number of packets sent for each lease probe. Lease probing is configured on a per-DHCP pool basis. When set to 0 probing is effectively disabled.

The **no** variant of this command sets the number of probe packets sent to the default of 5.

**Syntax** `probe packets <0-10>`  
`no probe packets`

| Parameter | Description                       |
|-----------|-----------------------------------|
| <0-10>    | The number of probe packets sent. |

**Default** The default is 5.

**Mode** DHCP Pool Configuration

**Examples** To set the number of probe packets to 2 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe packets 2
```

To set the number of probe packets to the default 5 for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe packets
```

**Related commands** [probe enable](#)  
[probe timeout](#)  
[probe type](#)  
[show ip dhcp pool](#)

# probe timeout

**Overview** Use this command to set the timeout value in milliseconds that the server waits for a response after each probe packet is sent. Lease probing is configured on a per-DHCP pool basis.

The **no** variant of this command sets the probe timeout value to the default setting, 200 milliseconds.

**Syntax** `probe timeout <50-5000>`  
`no probe timeout`

| Parameter                    | Description                       |
|------------------------------|-----------------------------------|
| <code>&lt;50-5000&gt;</code> | Timeout interval in milliseconds. |

**Default** The default timeout interval is 200 milliseconds.

**Mode** DHCP Pool Configuration

**Examples** To set the probe timeout value to 500 milliseconds for pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe timeout 500
```

To set the probe timeout value for pool P2 to the default, 200 milliseconds, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe timeout
```

**Related commands** [probe enable](#)  
[probe packets](#)  
[probe type](#)

# probe type

**Overview** Use this command to set the probe type for a DHCP pool. The probe type specifies how the DHCP server checks whether an IP address is being used by other hosts, referred to as lease probing. If **arp** is specified, the server sends an ARP request to determine if an address is in use. If **ping** is specified, the server will send an ICMP Echo Request (ping).

The **no** variant of this command sets the probe type to the default setting, ping.

**Syntax** `probe type {arp|ping}`  
`no probe type`

| Parameter | Description       |
|-----------|-------------------|
| arp       | Probe using ARP.  |
| ping      | Probe using ping. |

**Default** The default probe type is ping.

**Mode** DHCP Pool Configuration

**Examples** To set the probe type to `arp` for the pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# probe type arp
```

To set the probe type for the pool `P2` to the default, `ping`, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no probe type
```

**Related commands**

# range

**Overview** This command adds an address range to the DHCP address pool you are configuring. The DHCP server responds to client requests received from the pool's network. It assigns an IP addresses within the specified range. The IP address range must lie within the network. You can add multiple address ranges and individual IP addresses for a DHCP pool by using this command multiple times.

The **no** variant of this command removes an address range from the DHCP pool. Use the **no range all** command to remove all address ranges from the DHCP pool.

**Syntax** `range <ip-address> [<ip-address>]`  
`no range <ip-address> [<ip-address>]`  
`no range all`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | IPv4 address range for DHCP clients, in dotted decimal notation. The first IP address is the low end of the range, the second IP address is the high end. Specify only one IP address to add an individual IP address to the address pool. |

**Mode** DHCP Configuration

**Examples** To add an address range of 192.0.2.5 to 192.0.2.16 to the pool Nerv\_Office, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# range 192.0.2.5 192.0.2.16
```

To add the individual IP address 192.0.2.2 to a pool, use the command:

```
awplus(dhcp-config)# range 192.0.2.2
```

To remove all address ranges from a pool, use the command:

```
awplus(dhcp-config)# no range all
```

**Related commands**

- `ip dhcp pool`
- `service dhcp-server`
- `show ip dhcp pool`

# route

**Overview** This command allows the DHCP server to provide static routes to clients.

**Syntax** route A.B.C.D/M A.B.C.D {both|opt249|rfc3442}

| Parameter | Description                            |
|-----------|--|
| A.B.C.D/M | Subnet for the route                   |
| A.B.C.D   | Next hop for the route                 |
| both      | opt249 and rfc3442                     |
| opt249    | Classless static route option for DHCP |
| rfc3442   | Classless static route option for DHCP |

**Mode** DHCP Configuration

**Examples** To distribute static routes for route 0.0.0.0/0 whose next hop is 192.16.1.1 to clients using both opt249 and rfc3442, use the command:

```
awplus# configure terminal
awplus(config)# ip dhcp pool public
awplus(dhcp-config)# route 0.0.0.0/0 192.16.1.1 both
```

**Related commands** [ip dhcp pool](#)

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# service dhcp-server

**Overview** This command enables the DHCP server on your device. The server then listens for DHCP requests on all IP interfaces. It will not run if there are no IP interfaces configured.

The **no** variant of this command disables the DHCP server.

**Syntax** `service dhcp-server`  
`no service dhcp-server`

**Mode** Global Configuration

**Example** To enable the DHCP server, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-server
```

**Related commands** [ip dhcp pool](#)  
[show ip dhcp server summary](#)  
[subnet-mask](#)

# short-lease-threshold

**Overview** Use this command to configure a short lease threshold.

Use the **no** variant of this command to return the short lease threshold to the default of one minute.

**Syntax** `short-lease-threshold <hours> <minutes>`  
`no short-lease-threshold`

| Parameter                    | Description                          |
|------------------------------|--------------------------------------|
| <code>&lt;hours&gt;</code>   | The number of hours, from 0 to 24.   |
| <code>&lt;minutes&gt;</code> | The number of minutes, from 0 to 60. |

**Default** 1 minute.

**Mode** DHCP Configuration

**Usage notes** DHCP leases need to be backed up in NVS so that when the DHCP server reboots or goes through a power cycle it won't lose all the knowledge of these leases.

Some networks have a high number of mobile devices repeatedly requesting DHCP leases every few seconds before their existing lease expires. This can happen for example, when mobile devices move in and out of a Wi-Fi zone or when Wi-Fi signal strength changes. This means the same IP address can have multiple lease entries which can take up unnecessary backup file space.

The **short-lease-threshold** command allows you to configure the threshold for a short lease, from 1 minute to 24 hours. Any lease less than the threshold is deemed to be a short lease and will NOT be backed up to NVS.

This is useful if you have:

- limited backup file space, and
- you don't need to restore leases after a device reboot or power cycle

**Example** To set the short lease threshold for address pool P2 to 40 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# short-lease-threshold 0 40
```

To set the short lease threshold for address pool Nerv\_Office to 5 hours and 35 minutes, use the following commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool Nerv_Office
awplus(dhcp-config)# short-lease-threshold 5 35
```

To return the short lease threshold to the default of one minute, use the following commands:

```
awplus# configure terminal
awplus(config)# no short-lease-threshold
```

# show counter dhcp-client

**Overview** This command shows counters for the DHCP client on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the message counters for the DHCP client on your device, use the command:

```
awplus# show counter dhcp-client
```

**Output** Figure 63-2: Example output from the **show counter dhcp-client** command

```
show counter dhcp-client
DHCPDISCOVER out      ..... 10
DHCPREQUEST out       ..... 34
DHCPCDECLINE out      ..... 4
DHCPRELEASE out       ..... 0
DHCPPOFFER in         ..... 22
DHCPACK in            ..... 18
DHCPNAK in            ..... 0
```

**Table 1:** Parameters in the output of the **show counter dhcp-client** command

| Parameter        | Description  |
|------------------|--|
| DHCPDISCOVER out | The number of DHCP Discover messages sent by the client.                     |
| DHCPREQUEST out  | The number of DHCP Request messages sent by the client.                      |
| DHCPCDECLINE out | The number of DHCP Decline messages sent by the client.                      |
| DHCPRELEASE out  | The number of DHCP Release messages sent by the client.                      |
| DHCPPOFFER in    | The number of DHCP Offer messages received by the client.                    |
| DHCPACK in       | The number of DHCP Acknowledgement messages received by the client.          |
| DHCPNAK in       | The number of DHCP Negative Acknowledgement messages received by the client. |

```

| Parameter            | Description  |
|----------------------|--|
| Requests In          | The number of DHCP Request messages received from clients.   |
| Replies In           | The number of DHCP Reply messages received from servers.   |
| Relayed To Server    | The number of DHCP Request messages relayed to servers.  |
| Relayed To Client    | The number of DHCP Reply messages relayed to clients.  |
| Out To Server Failed | The number of failures when attempting to send request messages to servers. This is an internal debugging counter.   |
| Out To Client Failed | The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.   |
| Invalid hlen         | The number of incoming messages dropped due to an invalid hlen field.  |
| Bogus giaddr         | The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.  |
| Corrupt Agent Option | The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |

| Parameter            | Description  |
|----------------------|--|
| Missing Agent Option | The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |
| Bad Circuit ID       | The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                               |
| Missing Circuit ID   | The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                           |
| Bad Remote ID        | The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                                |
| Missing Remote ID    | The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command.                            |

| Parameter   | Description   |
|---|---|
| Option Insert Failed  | <p>The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when:</p> <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul> |
| <p>Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running</p> |   |
| DHCPv6 Requests In  | The number of incoming DHCPv6 Request messages.   |
| DHCPv6 Replies In   | The number of incoming DHCPv6 Reply messages.   |
| DHCPv6 Relayed to Server  | The number of DHCPv6 messages relayed to the server.  |
| DHCPv6 Relayed to Client  | The number of DHCPv6 messages relayed to the client.  |

# show counter dhcp-server

**Overview** This command shows counters for the DHCP server on your device.  
For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter dhcp-server`

**Syntax (VRF-lite)** `show counter dhcp-server [vrf <vrf-name>]`

| Parameter  | Description                            |

Table 2: Parameters in the output of the **show counter dhcp-server** command

| Parameter       | Description  |
|-----------------|--|
| DHCPDISCOVER in | The number of Discover messages received by the DHCP server. |
| DHCPREQUEST in  | The number of Request messages received by the DHCP server.  |
| DHCPCDECLINE in | The number of Decline messages received by the DHCP server.  |
| DHCPRELEASE in  | The number of Release messages received by the DHCP server.  |
| DHCPINFORM in   | The number of Inform messages received by the DHCP server.   |
| DHCPOFFER out   | The number of Offer messages sent by the DHCP server.        |

**Table 2:** Parameters in the output of the **show counter dhcp-server** command

| Parameter      | Description   |
|----------------|---|
| DHCPACK out    | The number of Acknowledgement messages sent by the DHCP server.   |
| DHCNACK out    | The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool. |
| BOOTREQUEST in | The number of bootp messages received by the DHCP server from bootp clients.  |
| BOOTREPLY out  | The number of bootp messages sent by the DHCP server to bootp clients.  |

# show dhcp lease

**Overview** This command shows details about the leases that the DHCP client has acquired from a DHCP server for interfaces on the device.

For information on filtering and saving command output, see “Controlling “show” Command Output” in the “Getting Started with AlliedWare\_Plus” Feature Overview and Configuration Guide.

**Syntax** `show dhcp lease [<interface>]`

| Parameter                      | Description                                       |
|--------------------------------|---|
| <code>&lt;interface&gt;</code> | Interface name to display DHCP lease details for. |

**Mode** User Exec and Privileged Exec

**Example** To show the current lease expiry times for all interfaces, use the command:

```
awplus# show dhcp lease
```

To show the current lease for vlan2, use the command:

```
awplus# show dhcp lease vlan2
```

**Output** Figure 63-7: Example output from the **show dhcp lease vlan1** command

```
Interface vlan1

# show ip dhcp binding

**Overview** This command shows the lease bindings that the DHCP server has allocated clients.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp binding [<ip-address>|<address-pool>]`

**Syntax (VRF-lite)** `show ip dhcp binding [vrf <name>] [<ip-address>|<address-pool>]`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>vrf</code>                  | Display the output for a VRF instance  |
| <code>&lt;name&gt;</code>         | The name of the specific VRF instance.   |
| <code>&lt;ip-address&gt;</code>   | IPv4 address of a leased IP address, in dotted decimal notation. This displays the lease information for the specified IP address. |
| <code>&lt;address-pool&gt;</code> | Name of an address pool. This displays the lease information for all clients within the address pool.                              |

**Mode** User Exec and Privileged Exec

**Examples** To display all leases for every client in all address pools, use the command:

```
awplus# show ip dhcp binding
```

To display the details for the leased IP address 172.16.2.16, use the command:

```
awplus# show ip dhcp binding 172.16.2.16
```

To display the leases from the address pool MyPool, use the command:

```
awplus# show ip dhcp binding MyPool
```

**Table 3:** Parameters in the output of the **show ip dhcp pool** command

| Parameter      | Description   |
|----------------|---|
| Pool           | Name of the pool.   |
| network        | Subnet and mask length of the pool.   |
| address ranges | Individual IP addresses and address ranges configured for the pool. The DHCP server can offer clients an IP address from within the specified ranges only.<br>Any of these addresses that match an interface address on the device, or a static host address configured in the pool, will be automatically excluded from the range, and a message to this effect will appear beneath the range entry. |

**Table 3:** Parameters in the output of the **show ip dhcp pool** command (cont.)

| Parameter                       | Description   |
|---------------------------------|---|
| static host addresses           | The static host addresses configured on the pool. Each IP address is permanently assigned to the client with the matching MAC address. Any of these addresses that match an interface address on the device will be automatically excluded, and a message to this effect will appear beneath the static host entry. |
| lease <days:hours:minutes>      | The lease duration for address allocated by this pool.  |
| domain                          | The domain name sent by the pool to clients. This is the domain name that the client should use when resolving host names using DNS.  |
| subnet mask                     | The subnet mask sent by the pool to clients.  |
| Probe - Status                  | Whether lease probing is enabled or disabled.   |
| Probe - Type                    | The lease probe type configured. Either ping or ARP.  |
| Probe - Packets                 | The number of packets sent for each lease probe in the range 0 to 10.   |
| Probe - Timeout                 | The timeout value in milliseconds to wait for a response after each probe packet is sent. In the range 50 to 5000.  |
| dns servers                     | The DNS server addresses sent to by the pool to clients.  |
| default-router(s)               | The default router addresses sent by the pool to clients.   |
| user-defined options            | The list of user-defined options sent by the pool to clients.   |
| Dynamic addresses- Total        | The total number of IP addresses that have been configured in the pool for dynamic allocation to DHCP clients.  |
| Dynamic addresses- Leased       | The number of IP addresses in the pool that have been dynamically allocated (leased) to DHCP clients.   |
| Dynamic addresses - Utilization | The percentage of IP addresses in the pool that are currently dynamically allocated to clients.   |
| Static host addresses- Total    | The number of static IP addresses configured in the pool for specific DHCP client hosts.  |
| Static host addresses - Leased  | The number of static IP addresses assigned to specific DHCP client hosts.   |

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

**Syntax (VRF-lite)** `show ip dhcp-relay [vrf <name>|global] [interface <interface-name>]`

| Parameter        | Description  |
|------------------|--|
| <interface-name> | Name of a specific interface. This displays the DHCP configuration for the specified interface only. |
| vrf              | Apply this command to a VRF instance.  |
| <vrf-name>       | The name of the VRF instance.  |
| global           | The Global VRF instance.   |

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 63-13: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

**Output (VRF-lite)** Figure 63-14: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers : 192.168.1.3
```

# show ip dhcp server statistics

**Overview** This command shows statistics related to the DHCP server.

You can display the server counters using the [show counter dhcp-server](#) command as well as with this command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show ip dhcp server statistics

**Syntax (VRF-lite)** show ip dhcp server statistics [vrf <name>]

| Parameter | Description                            |
|-----------|--|
| vrf       | Display the output for a VRF instance  |
| <name>    | The name of the specific VRF instance. |

**Mode** User Exec and Privileged Exec

**Example** To display the server statistics, use the command:

```
awplus# show ip dhcp server statistics
```

**Output** Figure 63-15: Example output from the **show ip dhcp server statistics** command

```
DHCP server counters
DHCPDISCOVER in      ..... 20
DHCYPREQUEST in     ..... 12
DHCPEDECLINE in     ..... 1
DHCYPRELEASE in     ..... 0
DHCPIFORM in        ..... 0
DHCPOFFER out       ..... 8
DHCPCACK out        ..... 4
DHCPCNAK out        ..... 0
BOOTREQUEST in      ..... 0
BOOTREPLY out       ..... 0
DHCPLEASEQUERY in   ..... 0
DHCPLEASEUNKNOWN out ..... 0
DHCPLEASEACTIVE out ..... 0
DHCPLEASEUNASSIGNED out ..... 0
```

**Output (VRF-lite)** Figure 63-16: Example output from the **show ip dhcp server statistics** command for VRF instance red

```

DHCP relay counters
[VRF: RED]
DHCPDISCOVER in          ..... 0
DHCPREQUEST in          ..... 7
DHCPDECLINE in          ..... 0
DHCPRELEASE in          ..... 0
DHCPINFORM in           ..... 0
DHCPOFFER out           ..... 0
DHCPACK out             ..... 7

DHCPLEASEQUERY in      ..... 0
DHCPLEASEUNKNOWN out   ..... 0
DHCPLEASEACTIVE out    ..... 0
DHCPLEASEUNASSIGNED out ..... 0
  
```

| Parameter       | Description   |
|-----------------|---|
| DHCPDISCOVER in | The number of Discover messages received by the DHCP server.  |
| DHCPREQUEST in  | The number of Request messages received by the DHCP server.   |
| DHCPDECLINE in  | The number of Decline messages received by the DHCP server.   |
| DHCPRELEASE in  | The number of Release messages received by the DHCP server.   |
| DHCPINFORM in   | The number of Inform messages received by the DHCP server.  |
| DHCPOFFER out   | The number of Offer messages sent by the DHCP server.   |
| DHCPACK out     | The number of Acknowledgement messages sent by the DHCP server.   |
| DHCPNAK out     | The number of Negative Acknowledgement messages sent by the DHCP server. The server sends these after receiving a request that it cannot fulfil because either there are no available IP addresses in the related address pool, or the request has come from a client that doesn't fit the network setting for an address pool. |
| BOOTREQUEST in  | The number of bootp messages received by the DHCP server from bootp clients.  |

| Parameter               | Description  |
|-------------------------|--|
| BOOTREPLY out           | The number of bootp messages sent by the DHCP server to bootp clients.                 |
| DHCPLEASEQUERY in       | The number of Lease Query messages received by the DHCP server from DHCP Relay Agents. |
| DHCPLEASEUNKNOWN out    | The number of Lease Unknown messages sent by the DHCP server to DHCP Relay Agents.     |
| DHCPLEASEACTIVE out     | The number of Lease Active messages sent by the DHCP server to DHCP Relay Agents.      |
| DHCPLEASEUNASSIGNED out | The number of Lease Unassigned messages sent by the DHCP server to DHCP Relay Agents.  |

**Related commands**

- [show ip dhcp pool](#)

**Command changes** Version 5.5.1-1.1: **vrf <name>** parameter added

# show ip dhcp server summary

**Overview** This command shows the current configuration of the DHCP server. This includes:

- whether the DHCP server is enabled
- whether the DHCP server is configured to ignore BOOTP requests
- whether the DHCP server is configured to support DHCP lease queries
- the details of any user-defined options
- a list of the names of all DHCP address pools currently configured

This show command does not include any configuration details of the address pools. You can display these using the [show ip dhcp pool](#) command.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp server summary`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of the DHCP server, use the command:

```
awplus# show ip dhcp server summary
```

**Output** Figure 63-17: Example output from the **show ip dhcp server summary** command

```
DHCP Server service is disabled
BOOTP ignore is disabled
DHCP leasequery support is disabled
Pool list: p2
```

**Related commands**

- [ip dhcp leasequery enable](#)
- [ip dhcp pool](#)
- [service dhcp-server](#)

# subnet-mask

**Overview** This command sets the subnet mask option for a DHCP address pool you are configuring. Use this command to specify the client's subnet mask as defined in RFC 950. This sets the subnet details using the pre-defined option 1. Note that if you create a user-defined option 1 using the [option](#) command, then you will override any settings created with this command. If you do not specify a subnet mask using this command, then the pool's network mask (specified using the [next-server](#) command) is applied.

The **no** variant of this command removes a subnet mask option from a DHCP pool. The pool reverts to using the pool's network mask.

**Syntax** `subnet-mask <mask>`  
`no subnet-mask`

| Parameter                 | Description   |
|---------------------------|---|
| <code>&lt;mask&gt;</code> | Valid IPv4 subnet mask, in dotted decimal notation. |

**Mode** DHCP Configuration

**Examples** To set the subnet mask option to 255.255.255.0 for DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# subnet-mask 255.255.255.0
```

To remove the subnet mask option from DHCP pool P2, use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P2
awplus(dhcp-config)# no subnet-mask
```

**Related commands**

- [default-router](#)
- [dns-server](#)

# vrf

**Overview** Use this command to add a VRF name to a DHCP server's address pool. This enables the DHCP server to become VRF-aware and allocate IP addresses which are the same as other pools.

One of the benefits of using this command is that it allows you to share DHCP leases across multiple isolated networks.

Use the **no** variant of this command to remove a VRF name from the DHCP server pool.

**Syntax** `vrf <vrf-name>`  
`no vrf`

| Parameter                     | Description                            |
|-------------------------------|--|
| <code>&lt;vrf-name&gt;</code> | The name of the specific VRF instance. |

**Default** Global VRF

**Mode** DHCP Configuration

**Usage notes** You need to enter this **vrf** command before entering the [network \(DHCP\)](#) and [range](#) address commands.

For more information, see the [DHCP Feature Overview and Configuration Guide](#).

**Example** To add the VRF name 'red' to the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# vrf red
```

To remove a VRF name from the DHCP pool named 'P1', use the commands:

```
awplus# configure terminal
awplus(config)# ip dhcp pool P1
awplus(dhcp-config)# no vrf
```

**Related commands** [network \(DHCP\)](#)

**Command changes** Version 5.5.1-1.1: command added

# 64

# DHCP for IPv6 (DHCPv6) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure DHCPv6. For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

DHCPv6 is a network protocol used to configure IPv6 hosts with IPv6 addresses and IPv6 prefixes for an IPv6 network. DHCPv6 is used instead of SLAAC (Stateless Address Autoconfiguration) at sites where centralized management of IPv6 hosts is needed. IPv6 routers require automatic configuration of IPv6 addresses and IPv6 prefixes.

DHCPv6 Prefix Delegation provides automatic configuration of IPv6 addresses and IPv6 prefixes.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**NOTE:** *The IPv6 addresses shown use the address space 2001:0db8::/32, defined in RFC 3849 for documentation purposes. These addresses should not be used for practical networks (other than for testing purposes) nor should they appear on any public network.*

# address prefix

**Overview** Use this command in DHCPv6 Configuration mode to specify an address prefix for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove the address prefix from the DHCPv6 server pool.

**Syntax** address prefix <ipv6-prefix/prefix-length> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]  
no address prefix <ipv6-prefix/prefix-length>

| Parameter                   | Description   |
|-----------------------------|---|
| <ipv6-prefix/prefix-length> | Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.   |
| lifetime                    | Specify a time period for the hosts to remember router advertisements (RAs). If you specify the optional lifetime parameter with this command then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value. See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry. |
| <valid-time>                | Specify a valid lifetime in seconds in the range <5-315360000>. The default valid lifetime is 2592000 seconds.  |
| infinite                    | Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.   |
| <preferred-time>            | Specify a preferred lifetime in seconds in the range <5-315360000>. The default preferred lifetime is 604800 seconds.   |

**Mode** DHCPv6 Configuration

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Usage notes** This command creates a pool of prefixes from which addresses are assigned to clients on request, and allocates a network prefix from which the DHCPv6 Server leases addresses. This command is an alternative to using a range set using the [address range](#) command.

The DHCPv6 Server selects an IPv6 address from the range available allocated by the IPv6 prefix, randomly generating the suffix of the IPv6 address, with the specified preferred and valid lifetime leases. Leased IPv6 address are found in the

DHCPv6 Server REPLY packet, which is located within the IANA (Identity Association for Non-temporary Addresses) IA address field in the **REPLY** message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add IPv6 address prefix `2001:0db8:1::/48` for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address prefix 2001:0db8:1::/48
```

To remove a configured IPv6 address prefix for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address prefix 2001:0db8:1::/48
```

**Related commands** [address range](#)  
[ipv6 dhcp pool](#)

**Validation Commands** [show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# address range

**Overview** Use this command in DHCPv6 Configuration mode to specify an address range for address assignment with DHCPv6 server pool configuration.

Use the **no** variant of this command to remove an address range from the DHCPv6 server pool.

**Syntax** `address range <first-ipv6-address>  
<last-ipv6-address>[lifetime {<valid-time>|infinite}  
{<preferred-time>|infinite}]  
no address range <first-ipv6-address> <last-ipv6-address>`

| Parameter                               | Description  |
|---|--|
| <code>&lt;first-ipv6-address&gt;</code> | Specify the first IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X: :X:X.   |
| <code>&lt;last-ipv6-address&gt;</code>  | Specify the last IPv6 address of the IPv6 address range, in hexadecimal notation in the format X:X: :X:X.  |
| <code>lifetime</code>                   | Optional. Specify a time period for the hosts to remember router advertisements (RAs).<br>If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value.<br>See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry. |
| <code>&lt;valid-time&gt;</code>         | Specify a valid lifetime in seconds in the range <5-31536000>.<br>The default valid lifetime is 2592000 seconds.   |
| <code>infinite</code>                   | Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.  |
| <code>&lt;preferred-time&gt;</code>     | Specify a preferred lifetime in seconds in the range <5-31536000>.<br>The default preferred lifetime is 604800 seconds.  |

**Default** The default valid lifetime is 2592000 seconds and the default preferred lifetime is 604800 seconds.

**Mode** DHCPv6 Configuration

**Usage** Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** To add the IPv6 address range 2001:0db8:1::1 to 2001:0db8:1fff::1 for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# address range 2001:0db8:1::1
2001:0db8:1fff::1
```

To remove a configured IPv6 address range for DHCPv6 server pool configuration, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# no address range
```

**Related commands** [address prefix](#)  
[ipv6 dhcp pool](#)

**Validation Commands** [show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# clear counter ipv6 dhcp-client

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 client counters.

**Syntax** `clear counter ipv6 dhcp-client`

**Mode** Privileged Exec

**Example** To clear DHCPv6 client counters, use the following command:

```
awplus# clear counter ipv6 dhcp-client
```

**Related commands** [show counter ipv6 dhcp-client](#)

# clear counter ipv6 dhcp-server

**Overview** Use this command in Privileged Exec mode to clear DHCPv6 server counters.

**Syntax** `clear counter ipv6 dhcp-server`

**Mode** Privileged Exec

**Example** To clear DHCPv6 server counters, use the following command:

```
awplus# clear counter ipv6 dhcp-server
```

**Related commands** [show counter ipv6 dhcp-server](#)

# clear ipv6 dhcp binding

**Overview** Use this command in Privileged Exec mode to clear either a specific lease binding or the lease bindings as specified by the command parameters. The command will only take effect on dynamically allocated bindings, not statically configured bindings. This command clears binding entries on the DHCPv6 server binding table.

**Syntax** `clear ipv6 dhcp binding {ipv6 <prefix>|duid <DUID>|all|pool <name>}`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>ipv6 &lt;prefix&gt;</code> | Optional. Specify the IPv6 prefix of the DHCPv6 client, in hexadecimal notation in the format <code>X:X::X:X</code> .  |
| <code>duid &lt;DUID&gt;</code>   | Specify the DUID (DHCPv6 unique ID) of the DHCPv6 client.  |
| <code>all</code>                 | All DHCPv6 bindings.   |
| <code>pool &lt;name&gt;</code>   | Description used to identify DHCPv6 server address pool. Valid characters are any printable character. If the name contains spaces then you must enclose these in "quotation marks". |

**Mode** Privileged Exec

**Usage notes** A specific binding may be deleted by **ipv6** address or **duid** address, or several bindings may be deleted at once using **all** or **pool**.

Note that if you specify to clear the **ipv6** or **duid** address of what is actually a static DHCPv6 binding, an error message is displayed. If **all** or **pool** are specified and one or more static DHCPv6 bindings exist within those addresses, any dynamic entries within those addresses are cleared but any static entries are not cleared.

The `clear ipv6 dhcp binding` command is used as a server function. A binding table entry on the DHCPv6 server is automatically:

- Created whenever a prefix is delegated to a client from the configuration pool.
- Updated when the client renews, rebinds, or confirms the prefix delegation.
- Deleted when the client releases all the prefixes in the binding, all prefix lifetimes have expired, or when a user runs the `clear ipv6 dhcp binding` command.

If the **clear ipv6 dhcp binding** command is used with the optional IPv6 address parameter, only the binding for the specified client is deleted. If the **clear ipv6 dhcp binding** command is used without the optional IPv6 address parameter, then all automatic client bindings are deleted from the DHCPv6 bindings table.

**Example** To clear all dynamic DHCPv6 server binding entries, use the command:

```
awplus# clear ipv6 dhcp binding all
```

**Output** Figure 64-1: Example output from the **clear ipv6 dhcp binding all** command

```
awplus#clear ipv6 dhcp binding all
% Deleted 1 entries
```

**Related commands** [show ipv6 dhcp binding](#)

# clear ipv6 dhcp client

**Overview** Use this command in Privileged Exec mode to restart a DHCPv6 client on an interface.

**Syntax** `clear ipv6 dhcp client <interface>`

| Parameter                      | Description   |
|--------------------------------|---|
| <code>&lt;interface&gt;</code> | Specify the interface name to restart a DHCPv6 client on. |

**Mode** Privileged Exec

**Example** To restart a DHCPv6 client on interface vlan1, use the following command:

```
awplus# clear ipv6 dhcp client vlan1
```

**Related commands** [show ipv6 dhcp binding](#)

# dns-server (DHCPv6)

**Overview** Use this command to add a Domain Name System (DNS) server to the DHCPv6 address pool you are configuring. You can use this command multiple times to create a list of DNS name servers available to the client. This sets the DNS server details using the pre-defined option 6. Note that if you add a user-defined option 6 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

Use the **no** variant of this command to remove either the specified DNS server or all DNS servers from the DHCPv6 pool.

**Syntax** `dns-server <ipv6-address>`  
`no dns-server [<ipv6-address>]`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;ipv6-address&gt;</code> | Specify an IPv6 address of the DNS server, in hexadecimal notation in the format <code>X:X::X:X</code> . This parameter is required when adding a DNS server to the DHCPv6 address pool. All DNS servers are removed from the DHCPv6 pool if you enter the <code>no dns-server</code> command without this parameter. |

**Mode** DHCPv6 Configuration

**Examples** To add the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` to the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# dns-server 2001:0db8:3000:3000::32
```

To remove the DNS server with the assigned IPv6 address `2001:0db8:3000:3000::32` from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server 2001:0db8:3000:3000::32
```

To remove all DNS servers from the DHCPv6 server pool named `P2`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no dns-server
```

**Related  
commands**    `ipv6 dhcp pool`  
                  `option (DHCPv6)`  
                  `show ipv6 dhcp pool`

# domain-name (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a domain name to the DHCPv6 server address pool you are configuring.

Use the **no** variant of this command to remove a domain name from the address pool.

**Syntax** `domain-name <domain-name>`  
`no domain-name`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;domain-name&gt;</code> | Specify the domain name you wish to assign the DHCPv6 server address pool. Valid characters are printable characters. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** DHCPv6 Configuration

**Usage** This command specifies the domain name that a client should use when resolving host names using the Domain Name System, and sets the domain name details using the pre- defined option 15. Note that if you add a user-defined option 15 using the [option \(DHCPv6\)](#) command, then you will override any settings created with this command.

**Examples** To add the domain name `Engineering` to DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# domain-name Engineering
```

To remove the domain name `Engineering` from DHCPv6 server pool `P2`, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(dhcpv6-config)# no domain-name Engineering
```

**Related commands** [dns-server \(DHCPv6\)](#)  
[option \(DHCPv6\)](#)  
[show ipv6 dhcp pool](#)

# ip dhcp-relay agent-option

**Overview** This command enables the DHCP Relay Agent to insert the DHCP Relay Agent Information Option (Option 82) into the client-request packets that it relays to its DHCP server. This allows the DHCP Relay Agent to pass on information to the server about the network location of the client device. The DHCP Relay Agent strips the DHCP Relay Agent Option 82 field out of the DHCP server's response, so that the DHCP client never sees this field.

When the DHCP Relay Agent appends its DHCP Relay Agent Option 82 data into the packet, it first overwrites any pad options present; then if necessary, it increases the packet length to accommodate the DHCP Relay Agent Option 82 data.

The **no** variant of this command stops the DHCP Relay Agent from appending the Option 82 field onto DHCP requests before forwarding it to the server.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** *The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands `ip dhcp-relay agent-option` and `ip dhcp-relay information policy` have been configured.*

**Syntax**

```
ip dhcp-relay agent-option
no ip dhcp-relay agent-option
```

**Default** DHCP Relay Agent Information Option (Option 82) insertion is disabled by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use this command to alter the DHCP Relay Agent Option 82 setting when your device is the first hop for the DHCP client. To limit the maximum length of the packet, use the [ip dhcp-relay max-message-length](#) command.

This command cannot be enabled if DHCP snooping is enabled on your device ([service dhcp-snooping](#) command), and vice versa.

**Examples** To make the DHCP Relay Agent listening on vlan2 append the DHCP Relay Agent Option 82 field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
```

To stop the DHCP Relay Agent from appending the DHCP Relay Agent Option 82 field on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option
```

**Related commands**

- ip dhcp-relay agent-option remote-id
- ip dhcp-relay information policy
- ip dhcp-relay max-message-length
- service dhcp-relay

# ip dhcp-relay agent-option subscriber-id-auto-mac

**Overview** This command causes the relay agent to insert the requesting clients' MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID option to assign the same IPv6 address to that requesting client every time it requires an address.

Use the no form of this command to disable this feature.

**Syntax** `ip dhcp-relay agent-option subscriber-id-auto-mac`  
`no ip dhcp-relay agent-option subscriber-id-auto-mac`

**Default** Disabled

**Usage notes** By default, DHCPv6 uses a DUID-LLT client identifier instead of a MAC address. This is generated by the operating system when DHCP first starts. If the OS is reinstalled the DUID-LLT can change, and any multiple operating systems on the machine will all have different DUIDs.

Configuring the subscriber-id-auto-mac option causes the relay agent to insert the requesting client's MAC address into a subscriber ID field in the relay header. A suitably-configured server can then use this subscriber ID to assign the same IPv6 address to that requesting client every time it connects.

The client must be in the same L2 network as the relay. If there are multiple relays between the client and the server, only the first relay will add a subscriber ID option.

**Example** To enable this feature on VLAN1, use the following commands:

```
awplus(config)#int vlan1
awplus(config-if)#ip dhcp-relay agent-option
subscriber-id-auto-mac
```

For an example of how to configure a relay agent and server, see the document "How to use DHCPv6 to assign specific IPv6 addresses to specific devices", available from [www.alliedtelesis.com](http://www.alliedtelesis.com).

# ip dhcp-relay agent-option checking

**Overview** This command enables the DHCP Relay Agent to check DHCP Relay Agent Information Option (Option 82) information in response packets returned from DHCP servers. If the information does not match the information it has for its own client (downstream) interface then the DHCP Relay Agent drops the packet. Note that [ip dhcp-relay agent-option](#) must be configured.

The DHCP Relay Agent Option 82 field is included in relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay agent-option checking`  
`no ip dhcp-relay agent-option checking`

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 check the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay agent-option
awplus(config-if)# ip dhcp-relay agent-option checking
```

To stop the DHCP Relay Agent on vlan2 from checking the DHCP Relay Agent Information Option (Option 82) field, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay agent-option checking
```

**Related commands** [ip dhcp-relay agent-option](#)  
[ip dhcp-relay agent-option remote-id](#)  
[ip dhcp-relay information policy](#)  
[service dhcp-relay](#)

# ip dhcp-relay agent-option remote-id

**Overview** Use this command to specify the Remote ID sub-option of the DHCP Relay Agent Option 82 field the DHCP Relay Agent inserts into clients' request packets. The Remote ID identifies the device that is inserting the DHCP Relay Agent Option 82 information. If a Remote ID is not specified, the Remote ID sub-option is set to the device's MAC address.

Use the **no** variant of this command to return the Remote ID for an interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay agent-option remote-id <remote-id>  
no ip dhcp-relay agent-option remote-id
```

| Parameter   | Description  |
|-------------|--|
| <remote-id> | An alphanumeric (ASCII) string, 1 to 63 characters in length. Additional characters allowed are hyphen (-), underscore (_) and hash (#). Spaces are not allowed. |

**Default** The Remote ID is set to the device's MAC address by default.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The Remote ID sub-option is included in the DHCP Relay Agent Option 82 field of relayed client DHCP packets if:

- DHCP Relay Agent Option 82 is enabled ([ip dhcp-relay agent-option](#)), and
- DHCP Relay Agent is enabled on the device ([service dhcp-relay](#))

**Examples** To set the Remote ID to myid for client DHCP packets received on vlan2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface vlan2  
awplus(config-if)# ip dhcp-relay agent-option remote-id myid
```

To remove the Remote ID specified for vlan2, use the commands:

```
awplus# configure terminal  
awplus(config)# interface vlan2  
awplus(config-if)# no ip dhcp-relay agent-option remote-id
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [show ip dhcp-relay](#)

# ip dhcp-relay information policy

**Overview** This command sets the policy for how the DHCP relay deals with packets arriving from the client that contain DHCP Relay Agent Option 82 information.

If the command **ip dhcp-relay agent-option** has not been configured, then this command has no effect at all - no alteration is made to Option 82 information in packets arriving from the client side.

However, if the command **ip dhcp-relay agent-option** has been configured, this command modifies how the DHCP relay service deals with cases where the packet arriving from the client side already contains DHCP Relay Agent Option 82 information.

This command sets the action that the DHCP relay should take when a received DHCP client request contains DHCP Relay Agent Option 82 information.

By default, the DHCP Relay Agent replaces any existing DHCP Relay Agent Option 82 field with its own DHCP Relay Agent field. This is equivalent to the functionality of the **replace** parameter.

The **no** variant of this command returns the policy to the default behavior - i.e. replacing the existing DHCP Relay Agent Option 82 field.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**NOTE:** The DHCP-relay service might alter the content of the DHCP Relay Agent Option 82 field, if the commands [ip dhcp-relay agent-option](#) and [ip dhcp-relay information policy](#) have been configured.

**Syntax**

```
ip dhcp-relay information policy {append|drop|keep|replace}
no ip dhcp-relay information policy
```

| Parameter | Description  |
|-----------|--|
| append    | The DHCP Relay Agent appends the DHCP Relay Agent Option 82 field of the packet with its own DHCP Relay Agent Option 82 details.                               |
| drop      | The DHCP Relay Agent discards the packet.  |
| keep      | The DHCP Relay Agent forwards the packet without altering the DHCP Relay Agent Option 82 field.  |
| replace   | The DHCP Relay Agent replaces the existing DHCP Relay Agent details in the DHCP Relay Agent Option 82 field with its own details before forwarding the packet. |

**Mode** Interface Configuration for VLAN interfaces.

**Examples** To make the DHCP Relay Agent listening on vlan2 drop any client requests that already contain DHCP Relay Agent Option 82 information, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay information policy drop
```

To reset the DHCP relay information policy to the default policy for interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay information policy
```

**Related commands**

- [ip dhcp-relay agent-option](#)
- [ip dhcp-relay agent-option checking](#)
- [service dhcp-server](#)

# ip dhcp-relay maxhops

**Overview** This command sets the hop count threshold for discarding BOOTP messages. When the hops field in a BOOTP message exceeds the threshold, the DHCP Relay Agent discards the BOOTP message. The hop count threshold is set to 10 hops by default.

Use the **no** variant of this command to reset the hop count to the default.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay maxhops <1-255>`  
`no ip dhcp-relay maxhops`

| Parameter | Description                  |
|-----------|------------------------------|
| <1-255>   | The maximum hop count value. |

**Default** The default hop count threshold is 10 hops.

**Mode** Interface Configuration for VLAN interfaces.

**Example** To set the maximum number of hops to 5 for packets received on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay maxhops 5
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay max-message-length

**Overview** This command applies when the device is acting as a DHCP Relay Agent and DHCP Relay Agent Option 82 insertion is enabled. It sets the maximum DHCP message length (in bytes) for the DHCP packet with its DHCP Relay Agent Option 82 data inserted. From this value it calculates the maximum packet size that it will accept at its input. Packets that arrive greater than this value will be dropped.

The **no** variant of this command sets the maximum message length to its default of 1400 bytes.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax** `ip dhcp-relay max-message-length <548-1472>`  
`no ip dhcp-relay max-message-length`

| Parameter  | Description   |
|------------|---|
| <548-1472> | The maximum DHCP message length (this is the message header plus the inserted DHCP option fields in bytes). |

**Default** The default is 1400 bytes.

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** When a DHCP Relay Agent (that has DHCP Relay Agent Option 82 insertion enabled) receives a request packet from a DHCP client, it will append the DHCP Relay Agent Option 82 component data, and forward the packet to the DHCP server. The DHCP client will sometimes issue packets containing pad option fields that can be overwritten with Option 82 data.

Where there are insufficient pad option fields to contain all the DHCP Relay Agent Option 82 data, the DHCP Relay Agent will increase the packet size to accommodate the DHCP Relay Agent Option 82 data. If the new (increased) packet size exceeds that defined by the **maximum-message-length** parameter, then the DHCP Relay Agent will drop the packet.

**NOTE:** Before setting this command, you must first run the `ip dhcp-relay agent-option` command. This will allow the DHCP Relay Agent Option 82 fields to be appended.

**Example** To set the maximum DHCP message length to 1200 bytes for packets arriving in interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay max-message-length 1200
```

To reset the maximum DHCP message length to the default of 1400 bytes for packets arriving in interface `vlan2`, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay max-message-length
```

**Related commands** [service dhcp-relay](#)

# ip dhcp-relay server-address

**Overview** This command adds a DHCP server for the DHCP Relay Agent to forward client DHCP packets to on a particular interface. You can add up to five DHCP servers on each device interface that the DHCP Relay Agent is listening on.

The **no** variant of this command deletes the specified DHCP server from the list of servers available to the DHCP relay agent.

The **no ip dhcp-relay** command removes all DHCP relay settings from the interface.

For DHCP Relay Agent and DHCP Relay Agent Option 82 introductory information, see the [DHCP Feature Overview and Configuration Guide](#).

**Syntax**

```
ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay server-address {<ipv4-address>|<ipv6-address>
<server-interface>}

no ip dhcp-relay
```

| Parameter          | Description   |
|--------------------|---|
| <ipv4-address>     | Specify the IPv4 address of the DHCP server for the DHCP Relay Agent to forward client DHCP packets to, in dotted decimal notation. The IPv4 address uses the format A.B.C.D. |
| <ipv6-address>     | Specify the IPv6 address of the DHCPv6 server for the DHCPv6 Relay Agent to forward client DHCP packets to, in hexadecimal notation.  |
| <server-interface> | Specify the interface name of the DHCPv6 server. It is only required for a DHCPv6 server with an IPv6 address.  |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** For a DHCP server with an IPv6 address you must specify the interface for the DHCP server. See examples below for configuration differences between IPv4 and IPv6 DHCP relay servers.

See also the [service dhcp-relay](#) command to enable the DHCP Relay Agent on your device. The [ip dhcp-relay server-address](#) command defines a relay destination on an interface on the device, needed by the DHCP Relay Agent to relay DHCP client packets to a DHCP server.

**Examples: DHCP for IPv4** To enable the DHCP Relay Agent to relay DHCP packets on interface vlan2 to the DHCP server with the IPv4 address 192.0.2.200, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan2
awplus(config-if)# ip dhcp-relay server-address 192.0.2.200
```

To remove the DHCP server with the IPv4 address 192.0.2.200 from the list of servers available to the DHCP Relay Agent on interface vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay server-address 192.0.2.200
```

**Examples: DHCPv6** To enable the DHCP Relay Agent on your device to relay DHCP packets on interface vlan10 to the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
awplus(config)# interface vlan10
awplus(config-if)# ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

To remove the DHCP server with the IPv6 address 2001:0db8:010d::1 on interface vlan20 from the list of servers available to the DHCP Relay Agent on interface vlan10, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan10
awplus(config-if)# no ip dhcp-relay server-address
2001:0db8:010d::1 vlan20
```

**Example: disabling DHCP relay** To disable DHCP relay on vlan2, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ip dhcp-relay
```

**Related commands** [service dhcp-relay](#)

# ipv6 address (DHCPV6 PD)

**Overview** Use this command to append an IPv6 address suffix to the IPv6 prefix provided by a DHCPV6 Prefix Delegation (PD) server.

Use the **no** variant of this command to remove the IPv6 address assigned and disable IPv6. Note that if no global addresses are left after removing the IPv6 address then IPv6 is disabled.

**Syntax** `ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`  
`no ipv6 address [<ipv6-prefix-name>] <ipv6-addr/prefix-length> [eui64]`

| Parameter                                    | Description   |
|--|---|
| <code>&lt;ipv6-prefix-name&gt;</code>        | The IPv6 prefix name advertised on the router advertisement message sent from the device. The IPv6 prefix name is delegated from the DHCPV6 Server configured for DHCPV6 Prefix-Delegation. |
| <code>&lt;ipv6-addr/prefix-length&gt;</code> | Specifies the IPv6 address to be set, for example ::1/64. The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.                       |
| <code>eui64</code>                           | EUI-64 is a method of automatically deriving the lower 64 bits of an IPv6 address, based on the switch's MAC address.   |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** When specifying the **eui64** parameter, the interface identifier of the IPv6 address is derived from the MAC address of the device.

For more information about EUI64, see the [IPv6 Feature Overview and Configuration Guide](#).

**Examples** To assign the IPv6 address 2001:0db8::a2/48 to the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::a2/48
```

To remove the IPv6 address 2001:0db8::a2/48 from the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::a2/48
```

To assign the **eui64** derived address in the prefix 2001:0db8::/64 to VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 address 2001:0db8::/64 eui64
```

To remove the **eui64** derived address in the prefix 2001:0db8::/64 from VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address 2001:0db8::/64 eui64
```

To configure a PD prefix named 'prefix1' on interface vlan2 and then add an IPv6 address, use the following commands. In this example, the prefix will be assigned from the pool on the PD client. The host portion or suffix will be ::1 for the last 64 bits:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 address prefix1::1/64
```

# ipv6 address dhcp

**Overview** Use this command to activate the DHCPv6 client on the interface that you are configuring. This allows the interface to use the DHCPv6 client to obtain its IPv6 configuration details from a DHCPv6 server on its connected network.

The command also enables IPv6 on the interface, which creates an EUI-64 link-local address as well as enabling RA processing and SLAAC.

Use the **no** variant of this command to stop the interface from obtaining IPv6 configuration details from a DHCPv6 server.

The DHCPv6 client supports the following IP configuration options:

- Option 1—the subnet mask for your device.
- Option 3—a list of default routers.
- Option 6—a list of DNS servers. This list appends the DNS servers set on your device with the [dns-server \(DHCPv6\)](#) command.
- Option 15—a domain name used to resolve host names. This option replaces any domain name that you have set with the [domain-name \(DHCPv6\)](#) command.
- Option 51—lease expiration time.

**Syntax** `ipv6 address dhcp [default-route-to-server]`  
`no ipv6 address dhcp`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>default-route-to-server</code> | Allow the automatic configuration of a default route to the DHCPv6 server. This option is not enabled by default when you enable the DHCP client on an interface. |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** Use the **default-route-to-server** option to allow the automatic configuration of a default route to the DHCPv6 server. Note that this option is not enabled by default when you enable the DHCP client on an interface.

**Examples** To set the interface `vlan2` to use DHCPv6 to obtain an IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 address dhcp
```

To stop the interface vlan2 from using DHCPv6 to obtain its IPv6 address, use the commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 address dhcp
```

**Related  
commands**

[clear ipv6 dhcp client](#)  
[ipv6 address](#)  
[ipv6 address \(DHCPv6 PD\)](#)  
[show ipv6 dhcp interface](#)  
[show running-config](#)

# ipv6 dhcp client pd

**Overview** Use this command in Interface Configuration mode to enable the DHCPv6 client process and enable requests for prefix delegation through the interface that you are configuring.

Use the **no** variant of this command to disable requests for prefix delegation. This is the default setting.

For further information about DHCPv6 Prefix Delegation, which is used to automate the process of assigning prefixes, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Syntax** `ipv6 dhcp client pd <prefix-name> <default-route-to-server>`  
`no ipv6 dhcp client pd`

| Parameter                                    | Description   |
|--|---|
| <code>&lt;prefix-name&gt;</code>             | Specify an IPv6 general prefix name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |
| <code>&lt;default-route-to-server&gt;</code> | Specify the default route to the DHCP server  |

**Mode** Interface Configuration for VLAN interfaces.

**Default** Prefix delegation is disabled by default on an interface.

**Usage notes** Entering the **ipv6 dhcp client pd** command starts the DHCPv6 client process if not already running, and enables requests for prefix delegation through the interface on which the command is configured.

When prefix delegation is enabled and a prefix is acquired, the prefix is stored in the IPv6 prefix pool with an internal name defined by the required `<prefix-name>` placeholder parameter. The [ipv6 address](#) command can then refer to the prefixes stored in the IPv6 prefix pool.

**Examples** To enable prefix delegation with the prefix name my-prefix-name on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd my-prefix-name
```

To disable prefix delegation on the VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp client pd
```

**Related  
commands**

- ipv6 enable
- clear ipv6 dhcp client
- ipv6 address (DHCPv6 PD)
- ipv6 nd prefix (DHCPv6)
- show ipv6 dhcp binding
- show ipv6 dhcp interface

# ipv6 dhcp option

**Overview** Use this command in Global Configuration mode to create a user-defined DHCPv6 option. You can then use this option when configuring a DHCPv6 server address pool, by using the [option \(DHCPv6\)](#) command.

Options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

Use the **no** variant of this command to remove either the specified user-defined option. This also removes user-defined options from the associated DHCPv6 server address pools.

**Syntax** `ipv6 dhcp option <1-254> [name <option-name>] [<option-type>]`  
`no ipv6 dhcp option <1-254>|<option-name>`

| Parameter     | Description  |       |                      |     |   |      |  |         |                                |      |   |
|---------------|--|-------|----------------------|-----|---|------|--|---------|--------------------------------|------|---|
| <1-254>       | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition.   |       |                      |     |   |      |  |         |                                |      |   |
| <option-name> | Option name used to identify the option. You cannot use a number as the option name. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".<br>Default: no default   |       |                      |     |   |      |  |         |                                |      |   |
| <option-type> | The option value. You must specify a value that is appropriate to the option type: <table border="1" data-bbox="678 1317 1420 1861"> <tbody> <tr> <td>ascii</td> <td>An ASCII text string</td> </tr> <tr> <td>hex</td> <td>A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.</td> </tr> <tr> <td>ipv6</td> <td>An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code>. To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.</td> </tr> <tr> <td>integer</td> <td>A number from 0 to 4294967295.</td> </tr> <tr> <td>flag</td> <td>A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b>, <b>on</b>, or <b>enabled</b> will set the flag. <b>false</b>, <b>off</b> or <b>disabled</b> will unset the flag.</td> </tr> </tbody> </table> | ascii | An ASCII text string | hex | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. | ipv6 | An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code> . To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times. | integer | A number from 0 to 4294967295. | flag | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag. |
| ascii         | An ASCII text string   |       |                      |     |   |      |  |         |                                |      |   |
| hex           | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long.  |       |                      |     |   |      |  |         |                                |      |   |
| ipv6          | An IPv6 address or prefix that has hexadecimal notation in the format <code>HHHH : HHHH : : HHHH : HHHH</code> . To create a list of IPv6 addresses, you must add each IPv6 address individually by using the option command multiple times.   |       |                      |     |   |      |  |         |                                |      |   |
| integer       | A number from 0 to 4294967295.   |       |                      |     |   |      |  |         |                                |      |   |
| flag          | A value that either sets (to 1) or unsets (to 0) a flag: <b>true</b> , <b>on</b> , or <b>enabled</b> will set the flag. <b>false</b> , <b>off</b> or <b>disabled</b> will unset the flag.  |       |                      |     |   |      |  |         |                                |      |   |

**Mode** Global Configuration

**Examples** To define a user-defined ASCII string option as option 66, without a name, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 66 ascii
```

To define a user-defined hexadecimal string option as option 46, with the name "tcpip-node-type", use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 46 name tcpip-node-type hex
```

To define a user-defined IP address option as option 175, with the name special-address, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 175 name special-address ip
```

To remove the specific user-defined option with the option number 12, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option 12
```

To remove the specific user-defined option with the option name perform-router-discovery, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp option perform-router-discovery
```

**Related commands**

[dns-server \(DHCPv6\)](#)  
[domain-name \(DHCPv6\)](#)  
[option \(DHCPv6\)](#)  
[show ipv6 dhcp](#)

# ipv6 dhcp pool

**Overview** Use this command in Global Configuration mode to enter the DHCPv6 Configuration mode for the DHCPv6 server pool name as specified in the required command parameter. If the name specified is not associated with an existing pool, the device will create a new pool with this name, then enter the configuration mode for the new pool.

Once you have entered the DHCPv6 configuration mode, all commands executed before the next **exit** command will apply to this pool.

You can create multiple DHCPv6 server pools on devices with multiple interfaces. This allows the device to act as a DHCPv6 server on multiple interfaces to distribute different information to clients on the different networks.

Use the **no** variant of this command to delete the specific DHCPv6 pool.

**Syntax** `ipv6 dhcp pool <DHCPv6-poolname>`  
`no ipv6 dhcp pool <DHCPv6-poolname>`

| Parameter                            | Description  |
|--------------------------------------|--|
| <code>&lt;DHCPv6-poolname&gt;</code> | Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Global Configuration

**Usage** All DHCPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create the DHCPv6 pool named P2 and enter DHCPv6 configuration mode, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)#
```

To delete the DHCPv6 pool named P2, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 dhcp pool P2
```

**Related commands**

- ipv6 local pool
- option (DHCPv6)
- prefix-delegation pool
- show ipv6 dhcp binding
- show ipv6 dhcp pool

# ipv6 dhcp server

**Overview** Use this command in Interface Configuration mode to enable DHCPv6 server for the current IPv6 configured interface to use the specified DHCPv6 server pool name.

The DHCPv6 server service listens for DHCPv6 requests on the IPv6 configured interface. The DHCPv6 server service does not run on interfaces without IPv6 configured on them.

Use the **no** variant of this command to disable the DHCPv6 server.

**Syntax** `ipv6 dhcp-server [<DHCPv6-poolname>]`  
`no ipv6 dhcp-server`

| Parameter         | Description   |
|-------------------|---|
| <DHCPv6-poolname> | Specify a named DHCPv6 server pool as defined with the <a href="#">ipv6 dhcp pool</a> command. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks". |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** The **ipv6 dhcp server** command enables the DHCPv6 service on a specified interface using the pool for prefix delegation and configuration through the specified interface.

Note that DHCPv6 client, DHCPv6 server and DHCPv6 relay are mutually exclusive on an interface. When one of the DHCPv6 functions is enabled on an interface then another DHCPv6 function cannot be enabled on the same interface.

**Examples** To enable the DHCPv6 server service and use the DHCPv6 pool named P2 on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 dhcp server P2
```

To disable the DHCPv6 server on VLAN interface vlan2, use the following commands:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 dhcp server
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp binding](#)  
[show ipv6 dhcp pool](#)

# ipv6 local pool

**Overview** Use this command in Global Configuration mode to configure a local DHCPv6 server prefix delegation pool specifying a poolname and a prefix/prefix length. You can optionally exclude the locally assigned prefix from the pool with the **exclude-local-prefix** keyword.

Use the **no** variant of this command to remove a local DHCPv6 server prefix delegation pool specifying the poolname.

**Syntax** `ipv6 local pool <DHCPv6-poolname> <delegated-prefix-name>  
<ipv6-prefix/prefix-length> <assigned-length>  
[exclude-local-prefix]`  
`no ipv6 local pool`

| Parameter                                      | Description  |
|--|--|
| <code>&lt;DHCPv6-poolname&gt;</code>           | Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".   |
| <code>&lt;delegated-prefix-name&gt;</code>     | Description used to identify the delegated prefix name from the parent PD (Prefix Delegation) server. If the name contains spaces then you must enclose it in "quotation marks".   |
| <code>&lt;ipv6-prefix/prefix-length&gt;</code> | Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool.<br>The IPv6 address uses the format X:X::X:X/Prefix-Length. The prefix-length is usually set between 0 and 64.   |
| <code>&lt;assigned-length&gt;</code>           | Specify an IPv6 prefix length assigned to the user from the pool in the range <1-128>. Note that the value of the <i>assigned-length</i> parameter entered cannot be less than or equal to the <i>prefix-length</i> parameter value entered. An assigned length must be longer than a prefix length. |
| <code>exclude-local-prefix</code>              | Specify this keyword to exclude the locally assigned prefix from the pool.   |

**Default** No DHCPv6 server prefix delegation pool is configured by default.

**Mode** Global Configuration

**Usage notes** All IPv6 prefix pool names must be unique. IPv6 prefix pools have a similar function to IPv4 address pools. Contrary to IPv4, a block of IPv6 addresses (an IPv6 address prefix) are assigned and not single IPv6 addresses. IPv6 prefix pools are not allowed to overlap.

Once a pool is configured, it cannot be changed. To change the configuration, you must remove then recreate a IPv6 prefix pool. All IPv6 prefixes already allocated are also freed.

**Examples** To create a local DHCPv6 local pool named P2 with the IPv6 prefix and prefix length 2001:0db8::/32 with an assigned length of 64, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 local pool P2 2001:0db8::/32 64
```

To remove a configured DHCPv6 local pool, use the following commands:

```
awplus# configure terminal
awplus(config)# no ipv6 local pool
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

# ipv6 nd prefix (DHCPv6)

**Overview** Use this command to specify IPv6 RA (Router Advertisement) prefix information generated from the DHCPv6 server for DHCPv6 prefix-delegation for an interface.

Use the **no** variant of this command to remove IPv6 RA prefix information from the DHCPv6 Server for DHCPv6 Prefix-Delegation for the interface. Use the **all** parameter with the **no** variant of this command to remove all prefix names and all prefixes for an interface.

**Syntax** `ipv6 nd prefix <ipv6-prefix-name>  
<ipv6-prefix/length>{<valid-lifetime>|infinite}  
{<preferred-lifetime>|infinite} {off-link|no-autoconfig}`  
`no ipv6 nd prefix {<ipv6-prefix-name>|<ipv6-prefix/length>|all}`

| Parameter                               | Description  |
|---|--|
| <code>&lt;ipv6-prefix-name&gt;</code>   | The IPv6 prefix name advertised on the router advertisement message sent from the device.<br>The IPv6 prefix name is delegated from the DHCPv6 Server configured for DHCPv6 Prefix-Delegation.   |
| <code>&lt;ipv6-prefix/length&gt;</code> | The IPv6 prefix and prefix length advertised on the router advertisement message sent from the device.<br>The IPv6 address prefix uses the format X:X::/prefix-length. The prefix-length is usually set between 0 and 64.  |
| <code>&lt;valid-lifetime&gt;</code>     | The the period during which the specified IPv6 address prefix is valid. This can be set to a value between 5 and 315360000 seconds. Note that this period should be set to a value greater than that set for the prefix preferred-lifetime. See the Usage notes after this parameter table for a description of valid lifetime and how it determines invalid IPv6 addresses upon expiry.   |
| <code>infinite</code>                   | Specifying this keyword instead of entering a value for the <code>&lt;valid-lifetime&gt;</code> parameter applies an infinite valid lifetime.  |
| <code>&lt;preferred-lifetime&gt;</code> | Specifies the IPv6 prefix preferred lifetime. This is the period during which the IPv6 address prefix is considered current. Set this to a value between 0 and 315360000 seconds. Note that this period should be set to a value less than that set for the prefix valid-lifetime. See the Usage notes after this parameter table for a description of preferred lifetime and how it determines deprecated IPv6 addresses upon expiry. |
| <code>infinite</code>                   | Specifying this keyword instead of entering a value for the <code>&lt;preferred-lifetime&gt;</code> parameter applies an infinite valid lifetime.  |
| <code>off-link</code>                   | Specify the IPv6 prefix off-link flag.   |
| <code>no-autoconfig</code>              | Specify the IPv6 prefix no autoconfiguration flag. Setting this flag indicates that the prefix is not to be used for autoconfiguration.  |
| <code>all</code>                        | Specify all prefix names and all prefixes are removed when used with the no variant of this command.   |

**Mode** Interface Configuration for VLAN interfaces.

**Usage notes** This command specifies the IPv6 prefix flags that are advertised by the router advertisement message.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Examples** The following example configures the device to issue RAs (Router Advertisements) on the VLAN interface `vlan2`, and advertises the DHCPv6 prefix name `prefix1` and the IPv6 address prefix of `2001:0db8::/32`.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# ipv6 enable
awplus(config-if)# ipv6 dhcp client pd prefix1
awplus(config-if)# ipv6 nd prefix prefix1 2001:0db8::/32
```

The following example resets router advertisements on the VLAN interface `vlan2`, so the address prefix of `2001:0db8::/32` is not advertised from the device.

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix 2001:0db8::/32
```

The following example removes all prefix names and prefixes from VLAN interface `vlan2`:

```
awplus# configure terminal
awplus(config)# interface vlan2
awplus(config-if)# no ipv6 nd prefix all
```

# link-address

**Overview** Use this command in DHCPv6 Configuration mode to specify a link-address prefix within a DHCPv6 Server pool.

Note that you can only configure one link address per DHCPv6 pool. Configuring another link address in the same DHCPv6 pool overwrites the previously configured link address.

Use the **no** variant of this command to remove the link-address prefix from the DHCPv6 Server pool.

**Syntax** `link-address <ipv6-prefix/prefix-length>`  
`no link-address`

| Parameter                                      | Description   |
|--|---|
| <code>&lt;ipv6-prefix/prefix-length&gt;</code> | Specify an IPv6 prefix and prefix length. The prefix length indicates the length of the IPv6 prefix assigned to the pool. The IPv6 address uses the format X:X::X/Prefix-Length. The prefix-length is usually set between 0 and 64. |

**Default** No DHCPv6 Server pool configuration link address prefix is configured by default.

**Mode** DHCPv6 Configuration

**Usage notes** Link addresses are configured in DHCPv6 Server address pools when there are remote clients that communicate via intermediate relay(s).

RELAY-FORW and RELAY-REPL relay packets contain the requesting link address source.

This command is used to match incoming requests from PD (Prefix Delegation) clients (received via an intermediate relay) to a configured delegation pool.

When an address on the incoming interface of the DHCPv6 server or a link address set in the incoming delegation request packet from the prefix delegation client matches the link-address prefix configured in the delegation pool, the DHCPv6 server is able to match and use the appropriate delegation pool for relayed delegation request messages.

If there is no match between incoming delegation request packets from the prefix delegation client and the link-address prefix configured in the delegation pool, the DHCPv6 Server does not delegate an IPv6 prefix to the requesting device.

The link address should be set to the network prefix where the prefix delegation client resides. The prefix delegation server will also need a forwarding path (IPv6 route) back to the network prefix where the prefix delegation client resides.

For more information, see the [DHCPv6 Feature Overview and Configuration Guide](#).

**Examples** To configure the IPv6 prefix and prefix length 2001:0db8:1::/48 as the link address for pool P2, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# address prefix 2001:0db8:2::/48
awplus(config-dhcp6)# link-address 2001:0db8:1::/48
```

To remove the link address, use the commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no link-address
```

**Related commands** [ipv6 dhcp pool](#)  
[show ipv6 dhcp pool](#)

# option (DHCPv6)

**Overview** Use this command in DHCPv6 Configuration mode to add a user-defined option to the DHCPv6 prefix pool you are configuring. For the **hex**, **integer**, and **flag** option types, if the option already exists, the new option overwrites the existing option's value.

Use the **no** variant of this command to remove the specified user-defined option from the DHCPv6 server pool, or to remove all user-defined options from the DHCPv6 server pool.

**Syntax** `option [<1-254>|<option-name>] <option-value>`  
`no option [<1-254>|<option-value>]`

| Parameter      | Description  |   |
|----------------|--|---|
| <1-254>        | The option number of the option. Options with the same number as one of the standard options overrides the standard option definition. |   |
| <option-name>  | Option name associated with the option.  |   |
| <option-value> | The option value. You must specify a value that is appropriate to the option type:   |   |
|                | hex  | A hexadecimal string. Valid characters are the numbers 0–9 and letters a–f. Embedded spaces are not valid. The string must be an even number of characters, from 2 and 256 characters long. |
|                | ipv6   | An IPv6 prefix that has the hexadecimal X:X::X:X notation. To create a list of IPv6 prefixes, you must add each IPv6 prefix individually using this command multiple times.                 |
|                | integer  | A number from 0 to 4294967295.  |
|                | flag   | A value of either true, on, or enabled to set the flag, or false, off or disabled to unset the flag.  |

**Mode** DHCPv6 Configuration

**Usage** You must define a DHCPv6 option using the `ipv6 dhcp option` command before using the `option (DHCPv6)` command.

Note that options with an **ipv6** type can hold a list of IPv6 prefix (i.e. entries that have the X:X::X:X address format), so if the option already exists in the pool, then the new IP address is added to the list of existing IPv6 prefixes. Also note options with the same number as one of the pre-defined options override the standard option definition. The pre-defined options use the option numbers 1, 3, 6, 15, and 51.

**Examples** To add the IPv6 type option named `sntp-server-addr` to the pool P2 and give the option the value `ipv6`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp option 22 name sntp_server_addr ipv6
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option sntp_server_addr ipv6
```

To add the ASCII-type option named `tftp-server-name` to the pool P2 and give the option the value `server1`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tftp-server-name server1
```

To add the hex-type option named `tcpip-node-type` to the pool P2 and give the option the value `08af`, use the following commands:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# option tcpip-node-type 08af
```

To add multiple IP addresses for the ip-type option 175, use the following commands:

```
awplus(config-dhcp6)# option 175 2001:0db8:3001::/64
awplus(config-dhcp6)# option 175 2001:0db8:3002::/64
awplus(config-dhcp6)# option 175 2001:0db8:3003::/64
```

To add the option 179 to a pool, and give the option the value `123456`, use the following command:

```
awplus(config-dhcp6)# option 179 123456
```

To add a user-defined flag option with the name `perform-router-discovery`, use the following command:

```
awplus(config-dhcp6)# option perform-router-discovery yes
```

To clear all user-defined options from a DHCP address pool, use the following command:

```
awplus(config-dhcp6)# no option
```

To clear a user-defined option, named `tftp-server-name`, use the following command:

```
awplus(config-dhcp6)# no option tftp-server-name
```

# prefix-delegation pool

**Overview** Use this command in DHCPv6 Configuration mode to add a DHCPv6 server prefix-delegation pool entry to the current DHCPv6 pool configuration. You must define a DHCPv6 server prefix-delegation pool using the `ipv6 dhcp pool` command before using this command.

Use the **no** variant of this command to remove a DHCPv6 server prefix-delegation pool from the current DHCPv6 pool configuration.

**Syntax** `prefix-delegation pool <DHCPv6-poolname> [lifetime {<valid-time>|infinite} {<preferred-time>|infinite}]`  
`no prefix-delegation pool <DHCPv6-poolname>`

| Parameter                            | Description   |
|--------------------------------------|---|
| <code>&lt;DHCPv6-poolname&gt;</code> | Description used to identify this DHCPv6 server pool. Valid characters are any printable character. If the name contains spaces then you must enclose it in "quotation marks".  |
| <code>lifetime</code>                | Optional. Specify a time period for the hosts to remember router advertisements (RAs). If you specify this parameter then you must also specify a <i>valid-time</i> and a <i>preferred-time</i> value.<br>See the Usage notes below this parameter table for a description of preferred and valid lifetimes and how these determine deprecated or invalid IPv6 addresses upon expiry. |
| <code>&lt;valid-time&gt;</code>      | Specify a valid lifetime in seconds in the range <code>&lt;5-315360000&gt;</code> .   |
| <code>infinite</code>                | Specify an infinite valid lifetime or an infinite preferred lifetime, or both, when using this keyword.   |
| <code>&lt;preferred-time&gt;</code>  | Specify a valid lifetime in seconds in the range <code>&lt;5-315360000&gt;</code> .   |

**Default** No IPv6 local prefix pool is specified by default.

**Mode** DHCPv6 Configuration

**Usage notes** The DHCPv6 server assigns prefixes dynamically from an IPv6 local prefix pool, which is configured using the `ipv6 local pool` command and is associated with a DHCPv6 configuration pool using this command. When the server receives a prefix request from a client, it attempts to obtain unassigned prefixes from the pool. After the client releases the previously assigned prefixes, the server returns the prefixes to the pool for reassignment.

Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires.

Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source

address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected.

An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.

**Example** This example adds DHCPv6 Prefix Delegation pool pd\_pool1 to DHCPv6 pool pool1:

```
awplus# configure terminal
awplus(config)# ipv6 local pool pd_pool1 2001:0db8::/48 56
awplus(config)# ipv6 dhcp pool pool1
awplus(config-dhcp6)# prefix-delegation pool pd_pool1
```

# service dhcp-relay

**Overview** This command enables the DHCP Relay Agent on the device. However, on a given IP interface, no DHCP forwarding takes place until at least one DHCP server is specified to forward/relay all clients' DHCP packets to.

The **no** variant of this command disables the DHCP Relay Agent on the device for all interfaces.

**Syntax** `service dhcp-relay`  
`no service dhcp-relay`

**Mode** Global Configuration

**Usage notes** A maximum number of 400 DHCP Relay Agents (one per interface) can be configured on the device. Once this limit has been reached, any further attempts to configure DHCP Relay Agents will not be successful.

**Default** The DHCP-relay service is enabled by default.

**Examples** To enable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# service dhcp-relay
```

To disable the DHCP relay global function, use the commands:

```
awplus# configure terminal
awplus(config)# no service dhcp-relay
```

# show counter dhcp-relay

**Overview** This command shows counters for the DHCP Relay Agent on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** show counter dhcp-relay

**Syntax (VRF-lite)** show counter dhcp-relay [vrf <vrf-name>|global]

| Parameter  | Description                                    |
|------------|--|
| vrf        | Display the output for a VRF instance          |
| <vrf-name> | The name of the specific VRF instance.         |
| global     | Display the output for the Global VRF instance |

**Mode** User Exec and Privileged Exec

**Examples** To display counters for the DHCP Relay Agent on your device, use the following command:

```
awplus# show counter dhcp-relay
```

**Output** Figure 64-2: Example output from the **show counter dhcp-relay** command

```
awplus#show counter dhcp-relay

Missing Agent Option ..... 0
Bad Circuit ID ..... 0
Missing Circuit ID ..... 0
Option Insert Failed ..... 0
  
```

| Parameter            | Description  |
|----------------------|--|
| Requests In          | The number of DHCP Request messages received from clients.   |
| Replies In           | The number of DHCP Reply messages received from servers.   |
| Relayed To Server    | The number of DHCP Request messages relayed to servers.  |
| Relayed To Client    | The number of DHCP Reply messages relayed to clients.  |
| Out To Server Failed | The number of failures when attempting to send request messages to servers. This is an internal debugging counter.   |
| Out To Client Failed | The number of failures when attempting to send reply messages to clients. This is an internal debugging counter.   |
| Invalid hlen         | The number of incoming messages dropped due to an invalid hlen field.  |
| Bogus giaddr         | The number of incoming DHCP Reply messages dropped due to the bogus giaddr field.  |
| Corrupt Agent Option | The number of incoming DHCP Reply messages dropped due to a corrupt relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |

| Parameter            | Description  |
|----------------------|--|
| Missing Agent Option | The number of incoming DHCP Reply messages dropped due to a missing relay agent information option field. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command. |
| Bad Circuit ID       | The number of incoming DHCP Reply messages dropped due to a bad circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command                                |
| Missing Circuit ID   | The number of incoming DHCP Reply messages dropped due to a missing circuit ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command                            |
| Bad Remote ID        | The number of incoming DHCP Reply messages dropped due to a bad remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command                                 |
| Missing Remote ID    | The number of incoming DHCP Reply messages dropped due to a missing remote ID. Note that Agent Option counters only increment on errors occurring if the <code>ip dhcp-relay agent-option</code> command is configured for an interface. Messages generating the errors are only dropped if the <code>ip dhcp-relay agent-option checking</code> command is configured on the interface as well as the <code>ip dhcp-relay agent-option</code> command                             |

| Parameter   | Description   |
|---|---|
| Option Insert Failed  | <p>The number of incoming DHCP Request messages dropped due to an error adding the DHCP Relay Agent information (option-82). This counter increments when:</p> <ul style="list-style-type: none"> <li>the DHCP Relay Agent is set to drop packets with the DHCP Relay Agent Option 82 field already filled by another DHCP Relay Agent. This policy is set with the <code>ip dhcp-relay information policy</code> command.</li> <li>there is a packet error that stops the DHCP Relay Agent from being able to append the packet with its DHCP Relay Agent Information Option (Option 82) field.</li> </ul> |
| <p>Note that the following parameters are only used on the Global VRF instance when DHCPv6 is running</p> |   |
| DHCPv6 Requests In  | The number of incoming DHCPv6 Request messages.   |
| DHCPv6 Replies In   | The number of incoming DHCPv6 Reply messages.   |
| DHCPv6 Relayed to Server  | The number of DHCPv6 messages relayed to the server.  |
| DHCPv6 Relayed to Client  | The number of DHCPv6 messages relayed to the client.  |

# show counter ipv6 dhcp-client

**Overview** Use this command in User Exec or Privilege Exec mode to show DHCPv6 client counter information. See [show counter ipv6 dhcp-server](#) for DHCPv6 server information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-client`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 client counter information, use the command:

```
awplus# show counter ipv6 dhcp-client
```

**Output** Figure 64-4: Example output from the **show counter ipv6 dhcp-client** command

```
awplus#show counter ipv6 dhcp-client
SOLICIT out          ..... 20
ADVERTISE in         ..... 12
REQUEST out          ..... 1
CONFIRM out          ..... 0
RENEW out            ..... 0
REBIND out           ..... 0
REPLY in             ..... 0
RELEASE out          ..... 0
DECLINE out          ..... 0
INFORMATION-REQUEST out ..... 0
```

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command

| Parameter    | Description   |
|--------------|---|
| SOLICIT out  | Displays the count of SOLICIT messages sent by the DHCPv6 client.       |
| ADVERTISE in | Displays the count of ADVERTISE messages received by the DHCPv6 client. |
| REQUEST out  | Displays the count of REQUEST messages sent by the DHCPv6 client.       |
| CONFIRM out  | Displays the count of CONFIRM messages sent by the DHCPv6 client.       |
| RENEW out    | Displays the count of RENEW messages sent by the DHCPv6 client.         |

**Table 1:** Parameters in the output of the **show counter ipv6 dhcp-client** command (cont.)

| Parameter               | Description   |
|-------------------------|---|
| REBIND out              | Displays the count of REBIND messages sent by the DHCPv6 client.              |
| REPLY in                | Displays the count of REPLY messages received by the DHCPv6 client.           |
| RELEASE out             | Displays the count of RELEASE messages sent by the DHCPv6 client.             |
| DECLINE out             | Displays the count of DECLINE messages sent by the DHCPv6 client.             |
| INFORMATION-REQUEST out | Displays the count of INFORMATION-REQUEST messages sent by the DHCPv6 client. |

**Related commands** [show counter ipv6 dhcp-server](#)

# show counter ipv6 dhcp-server

**Overview** Use this command in User Exec or Privileged Exec mode to show DHCPv6 server counter information. See [show counter ipv6 dhcp-client](#) for DHCPv6 client information.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show counter ipv6 dhcp-server`

**Mode** User Exec and Privileged Exec

**Example** To display the DHCPv6 server counter information, use the command:

```
awplus# show counter ipv6 dhcp-server
```

**Output** Figure 64-5: Example output from the **show counter ipv6 dhcp-server** command

```
awplus#show counter ipv6 dhcp-server
SOLICIT in          ..... 20
ADVERTISE out       ..... 12
REQUEST in          ..... 1
CONFIRM in          ..... 0
RENEW in            ..... 0
REBIND in           ..... 0
REPLY out           ..... 0
RELEASE in          ..... 0
DECLINE in          ..... 0
INFORMATION-REQUEST in ..... 0
RELAY FORWARD in   ..... 0
LEASEQUERY in      ..... 0
DHCPv4 QUERY in    ..... 0
```

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command

| Parameter     | Description   |
|---------------|---|
| SOLICIT in    | Displays the count of SOLICIT messages received by the DHCPv6 server. |
| ADVERTISE out | Displays the count of ADVERTISE messages sent by the DHCPv6 server.   |
| REQUEST in    | Displays the count of REQUEST messages received by the DHCPv6 server. |
| CONFIRM in    | Displays the count of CONFIRM messages received by the DHCPv6 server. |

**Table 2:** Parameters in the output of the **show counter ipv6 dhcp-server** command (cont.)

| Parameter              | Description  |
|------------------------|--|
| RENEW in               | Displays the count of RENEW messages received by the DHCPv6 server.              |
| REBIND in              | Displays the count of REBIND messages received by the DHCPv6 server.             |
| REPLY out              | Displays the count of REPLY messages sent by the DHCPv6 server.                  |
| RELEASE in             | Displays the count of RELEASE messages received by the DHCPv6 server.            |
| DECLINE in             | Displays the count of DECLINE messages received by the DHCPv6 server.            |
| INFORMATION-REQUEST in | Displays the count of INFORMATION-REQUEST messages received by the DHCPv6 server |
| RELAY FORWARD in       | Displays the count of Relay forward in messages received by the DHCPv6 server    |
| LEASEQUERY in          | Displays the count of LEASE QUERY messages received by the DHCPv6 server         |
| DHCPv4 QUERY in        | Displays the count of DHCPv4 QUERY messages received by the DHCPv6 server        |

**Related commands** [show counter ipv6 dhcp-client](#)

# show ip dhcp-relay

**Overview** This command shows the configuration of the DHCP Relay Agent on each interface.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ip dhcp-relay [interface <interface-name>]`

**Syntax (VRF-lite)** `show ip dhcp-relay [vrf <name>|global] [interface <interface-name>]`

| Parameter        | Description  |
|------------------|--|
| <interface-name> | Name of a specific interface. This displays the DHCP configuration for the specified interface only. |
| vrf              | Apply this command to a VRF instance.  |
| <vrf-name>       | The name of the VRF instance.  |
| global           | The Global VRF instance.   |

**Mode** User Exec and Privileged Exec

**Example** To display the DHCP Relay Agent’s configuration on the interface vlan2, use the command:

```
awplus# show ip dhcp-relay interface vlan2
```

**Output** Figure 64-6: Example output from the **show ip dhcp-relay** command

```
DHCP Relay Service is enabled

vlan2 is up, line protocol is up
Maximum hop count is 10
Insertion of Relay Agent Option is disabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay information policy is to append new relay agent
information
List of servers : 192.168.1.200
```

**Output (VRF-lite)** Figure 64-7: Example output from the **show ip dhcp-relay** command applied for VRF instance red

```
DHCP Relay Service is enabled

[VRF: red]
vlan2 is up, line protocol is up
Maximum hop count is 10
Maximum DHCP message length is 1400
Insertion of Relay Agent Option is enabled
Checking of Relay Agent Option is disabled
The Remote Id string for Relay Agent Option is 0000.cd28.074c
Relay Information policy is to replace existing relay agent
information
List of servers : 192.168.1.3
```

# show ipv6 dhcp

**Overview** Use this command in User Exec or Privileged Exec mode to show the DHCPv6 unique identifier (DUID) configured on your device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp`

**Mode** User Exec and Privileged Exec

**Usage notes** The DUID is based on the link-layer address for both DHCPv6 client and DHCPv6 server identifiers. The device uses the MAC address from the lowest interface number for the DUID.

The DUID is used by a DHCPv6 client to obtain an IPv6 address from a DHCPv6 server. A DHCPv6 server compares the DUID with its database of DUIDs and sends configuration data for an IPv6 address plus the preferred and valid lease time values to a DHCPv6 client.

**Example** To display the DUID configured on your device, use the command:

```
awplus# show ipv6 dhcp
```

**Output** Figure 64-8: Example output from the **show ipv6 dhcp** command

```
awplus#show ipv6 dhcp
DHCPv6 Server DUID: 0001000117ab6876001577f7ba23
```

**Related commands** [ipv6 address dhcp](#)

# show ipv6 dhcp binding

**Overview** Use this command in User Exec or Privileged Exec mode to show the IPv6 address entries that the DHCPv6 server leases to DHCPv6 clients. Note that applying this command with the optional *summary* keyword parameter displays the number of addresses per pool, but not the address or prefix entries per pool.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp binding [summary]`

| Parameter            | Description  |
|----------------------|--|
| <code>summary</code> | Optional. Specify the <b>summary</b> keyword to display summarized information for DHCPv6 server leases to client nodes, displaying the number of address entries per pool, not the addresses or prefixes. |

**Mode** User Exec and Privileged Exec

**Example 1** To display the total DHCPv6 leasing address entries for all pools, use the command:

```
awplus# show ipv6 dhcp binding summary
```

**Output** Figure 64-9: Example output from the **show ipv6 dhcp binding summary** command

```
awplus# show ipv6 dhcp binding summary
Pool Name                Number of Leased Addresses
-----
ia-na1                    3
ia-pd1                    5
Total in all Pools:      8
```

**Table 3:** Parameters in the output of the **show ipv6 dhcp binding summary** command

| Parameter                  | Description  |
|----------------------------|--|
| Pool Name                  | Displays a list of all the pool names.                             |
| Number of Leased Addresses | Displays the number of leased address entries for the pool.        |
| Total in all Pools         | Displays the total number of leased address entries for all pools. |

**Example 2** To display addresses, prefixes, and lifetimes for all DHCPv6 leasing entries by pool, enter:

```
awplus# show ipv6 dhcp binding
```

**Output** Figure 64-10: Example output from the **show ipv6 dhcp binding** command

```
awplus#show ipv6 dhcp binding
Pool ia-na1
  Address 2002:0:3c0::1
    client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2012 18:38:29
    expires at 19 Sep 2012 18:38:29
Pool ia-pd1
  Prefix 2002:0:3c0::/42
    client IAID 77f7ba23, DUID 0001000117c4bbb4001577f7ba23
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2012 18:38:29
    expires at 19 Sep 2012 18:38:29
```

**Table 4:** Parameters in the output of the **show ipv6 dhcp binding** command

| Parameter          | Description  |
|--------------------|--|
| Address            | Address delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.  |
| Prefix             | Prefix delegated to the indicated IAID and DUID. See the IAID and DUID descriptions below for further information.   |
| DUID               | DHCPv6 unique identifier (DUID) (see RFC 3315). Each DHCPv6 client has as DUID. DHCPv6 servers use DUIDs to identify clients for the association of IAs (Identity Associations) with DHCPv6 clients. DHCPv6 clients use DUIDs to identify a DHCPv6 server.   |
| IAID               | Identify Association Identifier (IAID) (see RFC 3315). IAIDs are identifiers for IAs (Identity Associations), where an IA is a collection of IPv6 addresses assigned to a DHCPv6 client. Each IA has an associated IAD. Each DHCPv6 client may have more than one IA assigned to it. Each IA holds one type of address.  |
| preferred lifetime | The preferred lifetime setting in seconds for the specified IAID and DUID. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. |
| valid lifetime     | The valid lifetime setting in seconds for the specified IAID and DUID. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet.  |

**Table 4:** Parameters in the output of the **show ipv6 dhcp binding** command

| Parameter  | Description  |
|------------|--|
| starts at  | The date and time at which the valid lifetime expires. |
| expires at | The date and time at which the valid lifetime expires. |

**Related  
commands**

[clear ipv6 dhcp binding](#)

[ipv6 dhcp pool](#)

[show ipv6 dhcp pool](#)

# show ipv6 dhcp interface

**Overview** Use this command in User Exec or Privileged Exec mode to display DHCPv6 information for a specified interface, or all interfaces when entered without the interface parameter.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp interface [<interface-name>]`

| Parameter                           | Description  |
|-------------------------------------|--|
| <code>&lt;interface-name&gt;</code> | Optional. Specify the name of the interface to show DHCPv6 information about. Omit this optional parameter to display DHCPv6 information for all interfaces DHCPv6 is configured on. |

**Mode** User Exec and Privileged Exec

**Example 1** To display DHCPv6 information for all interfaces DHCPv6 is configured on, use the command:

```
awplus# show ipv6 dhcp interface
```

**Output** Figure 64-11: Example output from the **show ipv6 dhcp interface** command

```
awplus# show ipv6 dhcp interface
vlan1 is in client mode
  Address 1001::3c0:1
    preferred lifetime 9000, valid lifetime 5000
    starts at 20 Jan 2021 09:21:35
    expires at 20 Jan 2021 10:25:32
vlan2 is in client (Prefix-Delegation) mode
  Prefix name pdl
    prefix 2002:0:3c0::/42
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2021 09:21:33
    expires at 19 Sep 2021 09:21:33
vlan3 is in server mode
  Using pool : pool-1; Preference:0
```

**Example 2** To display DHCPv6 information for interface vlan2, use the command:

```
awplus# show ipv6 dhcp interface vlan2
```

**Output** Figure 64-12: Example output from the **show ipv6 dhcp interface** command for a specific interface

```
awplus# show ipv6 dhcp interface vlan2
vlan2 is in client (Prefix-Delegation) mode
  Prefix name pdl
    prefix 2002:0:3c0::/42
    preferred lifetime 604800, valid lifetime 2592000
    starts at 20 Aug 2021 09:21:33
    expires at 19 Sep 2021 09:21:33
```

**Table 5:** Parameters in the output of the **show counter dhcp-client** command

| Parameter  | Description  |
|--|--|
| <interface> is in server/client/(Prefix-Delegation) mode | Displays whether the specified interface is in server or client mode and whether prefix-delegation is applied to an interface. |
| Address  | Displays the address of the DHCPv6 server on the interface.  |
| Prefix name  | Displays the IPv6 general prefix pool name, where prefixes are stored for the interface.                                       |
| Using pool   | Displays the name of the pool used by the interface.   |
| Preference   | Displays the preference value for the DHCPv6 server.   |

**Related commands** [ipv6 dhcp client pd](#)

# show ipv6 dhcp pool

**Overview** Use this command in User Exec or Privileged Exec mode to display the configuration details and system usage of the DHCPv6 address pools configured on the device.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

**Syntax** `show ipv6 dhcp pool [<DHCPv6-address-pool-name>]`

| Parameter                  | Description  |
|----------------------------|--|
| <DHCPv6-address-pool-name> | Name of a specific DHCPv6 address pool. This displays the configuration of the specified DHCPv6 address pool only. |

**Mode** User Exec and Privileged Exec

**Example** `awplus# show ipv6 dhcp pool`

**Output** Figure 64-13: Example output from the **show ipv6 dhcp pool** command

```
awplus# show ipv6 dhcp pool
DHCPv6 Pool: ia-na
Address Prefix : 1001::/64
                Lifetime: 2592000(valid), 604800(preferred)
DNS Server: 2001::1
DNS Server: 2001::2
Domain Name: example.com
Domain Name: example.co.jp
SNTP Server: 2001::5
SNTP Server: 2001::6
Option Code : 150
                Value: [ASCII] test-test
DHCPv6 Pool: ia-pd
PD Pool Name: pd1
Prefix : 2002::/38-42
Lifetime : 2592000(valid), 604800(preferred)
```

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command

| Parameter      | Description                        |
|----------------|------------------------------------|
| DHCPv6 Pool    | Name of the DHCPv6 pool.           |
| Address Prefix | Address prefix to the DHCPv6 pool. |

**Table 6:** Parameters in the output of the **show ipv6dhcp pool** command (cont.)

| Parameter           | Description  |
|---------------------|--|
| Address<br>Lifetime | Valid and preferred lifetimes to the DHCPv6 pool. Preferred IPv6 addresses or prefixes are available to interfaces for unrestricted use and are deprecated when the preferred timer expires. Deprecated IPv6 addresses and prefixes are available for use and are discouraged but not forbidden. A deprecated address or prefix should not be used as a source address or prefix, but packets sent from deprecated addresses or prefixes are delivered as expected. An IPv6 address or prefix becomes invalid and is not available to an interface when the valid lifetime timer expires. Invalid addresses or prefixes should not appear as the source or destination for a packet. |
| DNS Server          | IPv6 address of the DNS Server   |
| Domain name         | URL for the domain name.   |
| SNTP Server         | IPv6 address of the SNTP (Simple Network Time Protocol) Server.  |
| Option Code         | DHCP Option code (see RFC 2132).   |
| Option Value        | DHCP Option value type (see RFC 2132).   |

**Related commands** [ipv6 dhcp pool](#)

# sntp-address

**Overview** Use this command in DHCPv6 Configuration mode to add an SNTP Server IPv6 address to a DHCPv6 Server pool.

Use the **no** variant of this command to remove an SNTP Server IPv6 address from a DHCPv6 Server pool.

**Syntax** `sntp-address <ipv6-address>`  
`no sntp-address <ipv6-address>`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;ipv6-address&gt;</code> | Specify an SNTP Server IPv6 address, in hexadecimal notation in the format X:X::X:X. |

**Mode** DHCPv6 Configuration

**Examples** The following example adds an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# sntp-address 2001:0db8::/32
```

The following example removes an SNTP Server IPv6 address of 2001:0db8::/32 to the DHCPv6 pool named P2:

```
awplus# configure terminal
awplus(config)# ipv6 dhcp pool P2
awplus(config-dhcp6)# no sntp-address 2001:0db8::/32
```

# NTP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure the Network Time Protocol (NTP). For more information, see the [NTP Feature Overview and Configuration Guide](#).

The device can act as an NTP client to receive time from one or more NTP servers, and as an NTP server.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare\\_Plus” Feature Overview and Configuration Guide](#).

- Command List**
- [“ntp authentication-key”](#) on page 3758
  - [“ntp broadcastdelay”](#) on page 3760
  - [“ntp master”](#) on page 3761
  - [“ntp peer”](#) on page 3762
  - [“ntp rate-limit”](#) on page 3764
  - [“ntp restrict”](#) on page 3765
  - [“ntp server”](#) on page 3767
  - [“ntp source”](#) on page 3769
  - [“show ntp associations”](#) on page 3771
  - [“show ntp counters”](#) on page 3773
  - [“show ntp counters associations”](#) on page 3774
  - [“show ntp status”](#) on page 3775

# ntp authentication-key

**Overview** This command defines each of the authentication keys. Each key has a key number, a type (MD5 or SHA1), and a value.

The **no** variant of this disables the authentication key.

**Syntax** `ntp authentication-key <keynumber> md5 <key-string> [trusted]`  
`ntp authentication-key <keynumber> sha1 <key-string> [trusted]`

When in secure mode, MD5 is not available and the syntax in config files will be:

```
ntp authentication-key <keynumber> sha1-encrypted  
<encrypted-key-string> [trusted]  
no ntp authentication-key <keynumber>
```

| Parameter              | Description   |
|------------------------|---|
| <keynumber>            | <1-4294967295> An identification number for the key.  |
| md5                    | Define an MD5 key.  |
| sha1                   | Define an SHA1 key.   |
| <key-string>           | The authentication key. For SHA1, this is a 20 hexadecimal character string. For MD5, this is a string of up to 31 ASCII characters.  |
| sha1-encrypted         | This parameter indicates in running config that the key is in its encrypted form instead of in plaintext. If secure mode is enabled and you enter a SHA1 key, the running config will display this sha1-encrypted parameter instead of sha1, and will display the key in encrypted form. Do not enter a key using the sha1-encrypted parameter. Instead, enter sha1 and the unencrypted key string. |
| <encrypted-key-string> | The encrypted authentication key.   |
| trusted                | Add this key to the list of authentication keys that this server trusts.  |

**Mode** Global Configuration

**Examples** To define an MD5 authentication key number 134343 and a key value 'mystring', use the commands:

```
awplus# configure terminal  
awplus(config)# ntp authentication-key 134343 md5 mystring
```

To disable the authentication key number 134343 with the key value 'mystring', use the commands:

```
awplus# configure terminal  
awplus(config)# no ntp authentication-key 134343
```

**Command  
changes**

Version 5.4.9-2.1 sha1-encrypted parameter added.

# ntp broadcastdelay

**Overview** Use this command to set the estimated round-trip delay for broadcast packets. Use the **no** variant of this command to reset the round-trip delay for broadcast packets to the default offset of 0 microseconds.

**Syntax** `ntp broadcastdelay <delay>`  
`no ntp broadcastdelay`

| Parameter                  | Description  |
|----------------------------|--|
| <code>&lt;delay&gt;</code> | <code>&lt;1-999999&gt;</code> The broadcast delay in microseconds. |

**Default** 0 microsecond offset, which can only be applied with the **no** variant of this command.

**Mode** Global Configuration

**Examples** To set the estimated round-trip delay to 23464 microseconds for broadcast packets, use these commands:

```
awplus# configure terminal
awplus(config)# ntp broadcastdelay 23464
```

To reset the estimated round-trip delay for broadcast packets to the default setting (0 microseconds), use these commands:

```
awplus# configure terminal
awplus(config)# no ntp broadcastdelay
```

# ntp master

**Overview** Use this command to make the device to be an authoritative NTP server, even if the system is not synchronized to an outside time source.

Use the **no** variant of this command to stop the device being the designated NTP server.

**Syntax** `ntp master [<stratum>]`  
`no ntp master`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;stratum&gt;</code> | <code>&lt;1-15&gt;</code> The stratum number defines the configured level that is set for this master within the NTP hierarchy. The default stratum number is 12. |

**Mode** Global Configuration

**Usage notes** The stratum levels define the distance from the reference clock and exist to prevent cycles in the hierarchy. Stratum 1 is used to indicate time servers, which are more accurate than Stratum 2 servers. For more information on the Network Time Protocol go to: [www.ntp.org](http://www.ntp.org)

**Examples** To stop the device from being the designated NTP server, use the commands:

```
awplus# configure terminal  
awplus(config)# no ntp master
```

To make the device the designated NTP server with stratum number 2, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp master 2
```

# ntp peer

**Overview** Use this command to configure an NTP peer association. An NTP association is a peer association if this system is willing to either synchronize to the other system, or allow the other system to synchronize to it.

Use the **no** variant of this command to remove the configured NTP peer association.

**Syntax** `ntp peer {<peeraddress>|<peername>}`  
`ntp peer {<peeraddress>|<peername>} [prefer] [key <key>]`  
`[version <version>]`  
`no ntp peer {<peeraddress>|<peername>}`

| Parameter         | Description   |
|-------------------|---|
| <peeraddress>     | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X:X for an IPv6 address. |
| <peername>        | Specify the peer hostname. The peer hostname can resolve to an IPv4 and an IPv6 address.  |
| prefer            | Prefer this peer when possible.   |
| key <key>         | <1-4294967295><br>Configure the peer authentication key.  |
| version <version> | <1-4><br>Configure for this NTP version.  |

**Mode** Global Configuration

**Examples** See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv4 address of 192.0.2.23:

```
awplus# configure terminal
awplus(config)# ntp peer 192.0.2.23
awplus(config)# ntp peer 192.0.2.23 prefer
awplus(config)# ntp peer 192.0.2.23 prefer version 4
awplus(config)# ntp peer 192.0.2.23 prefer version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4 key 1234
awplus(config)# ntp peer 192.0.2.23 version 4
awplus(config)# ntp peer 192.0.2.23 key 1234
```

To remove an NTP peer association for this peer with an IPv4 address of 192.0.2.23, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 192.0.2.23
```

See the following commands for options to configure NTP peer association, key and NTP version for the peer with an IPv6 address of 2001:0db8:010d::1:

```
awplus# configure terminal
awplus(config)# ntp peer 2001:0db8:010d::1
awplus(config)# ntp peer 2001:0db8:010d::1 prefer
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4
awplus(config)# ntp peer 2001:0db8:010d::1 prefer version 4 key
1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4 key 1234
awplus(config)# ntp peer 2001:0db8:010d::1 version 4
awplus(config)# ntp peer 2001:0db8:010d::1 key 1234
```

To remove an NTP peer association for this peer with an IPv6 address of 2001:0db8:010d::1, use the following commands:

```
awplus# configure terminal
awplus(config)# no ntp peer 2001:0db8:010d::1
```

**Related  
commands**    [ntp server](#)  
                  [ntp source](#)

# ntp rate-limit

**Overview** Use this command to enable NTP server response rate-limiting. Limiting NTP server responses can reduce network traffic when occurrences such as misconfigured or broken NTP clients poll the NTP server too frequently. Excessive polling can lead to network overload.

Use the **no** variant of this command to remove the rate-limit configuration.

**Syntax** `ntp rate-limit {interval<1-4096>|burst <1-255>|leak <2-16>}`  
`no ntp rate-limit`

| Parameter | Description  |
|-----------|--|
| interval  | The minimum interval between responses configured in seconds. The default interval is 8 seconds.   |
| burst     | The maximum number of responses that can be sent in a burst, temporarily exceeding the limit specified by the interval option. The default burst is 8 responses.   |
| leak      | The rate at which responses are randomly allowed even if the limits specified by the interval and burst options are exceeded. The default leak is 4, i.e. on average, every fourth request has a response. |

**Mode** Global Configuration

**Default** Interval - 8 seconds.

Burst - 8 responses.

Leak - 4.

**Example** To configure an NTP rate-limiting interval of 30 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# ntp rate-limit interval 30
```

**Related commands** [ntp restrict](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp restrict

**Overview** Use this command to configure a restriction (allow or deny) on NTP packets or NTP functionality for a specific host/network or all hosts of a given IP family.

This means you can control host access to NTP service and NTP server status queries.

Use the **no** variant of this command to remove a restriction from one or more hosts.

**Syntax**

```
ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} query
{allow|deny}

ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>} serve
{allow|deny}

no ntp restrict
{default-v4|default-v6|<host-address>|<host-subnet>}
```

| Parameter      | Description  |
|----------------|--|
| default-v4     | Apply this restriction to all IPv4 hosts.  |
| default-v6     | Apply this restriction to all IPv6 hosts.  |
| <host-address> | Apply this restriction to the specified IPv4 or IPv6 host.<br>Enter an IPv4 address in the format A.B.C.D.<br>Enter an IPv6 address in the format X::X:X.          |
| <host-subnet>  | Apply this restriction to the specified IPv4 subnet or IPv6 prefix.<br>Enter an IPv4 subnet in the format A.B.C.D/M.<br>Enter an IPv6 prefix in the format X::X/X. |
| query          | Control NTP server status queries to matching hosts.   |
| serve          | Control NTP time service to matching hosts.  |
| allow          | Allow the configured restriction.  |
| deny           | Deny the configured restriction.   |

**Default** By default, time service is allowed to all hosts, and NTP server status querying is denied to all hosts.

**Mode** Global Configuration

**Example** To prevent all IPv4 hosts from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict default-v4 deny
```

To prevent the host 192.168.1.1 from accessing a device for NTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 198.168.1.1 deny
```

To allow all hosts in the 10.10.10.0/24 subnet to access a device for NTP server status, use the commands:

```
awplus# configure terminal
awplus(config)# ntp restrict 10.10.10.0/24 query allow
```

**Related commands** [ntp rate-limit](#)

**Command changes** Version 5.4.8-1.1: command added

# ntp server

**Overview** Use this command to configure an NTP server. This means that this system will synchronize to the other system, and not vice versa.

Use the **no** variant of this command to remove the configured NTP server.

**Syntax**

```
ntp server {<serveraddress>|<servername>}  
ntp server {<serveraddress>|<servername>} [prefer] [key <key>]  
[version <version>]  
no ntp server {<serveraddress>|<servername>}
```

| Parameter         | Description   |
|-------------------|---|
| <serveraddress>   | Specify the IP address of the peer, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |
| <servername>      | Specify the server hostname. The server hostname can resolve to an IPv4 and an IPv6 address.                                      |
| prefer            | Prefer this server when possible.   |
| key <key>         | <1-4294967295><br>Configure the server authentication key.  |
| version <version> | <1-4><br>Configure for this NTP version.  |

**Mode** Global Configuration

**Examples** To obtain the time by synchronizing with the server at 192.0.1.23, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp server 192.0.1.23
```

To obtain the time by synchronizing with the server at 192.0.1.23, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp server 192.0.1.23 prefer
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal  
awplus(config)# ntp server 2001:0db8:010e::2
```

To obtain the time by synchronizing with the server at 2001:0db8:010e::2, and specify that this is the best server to use, use the commands:

```
awplus# configure terminal
awplus(config)# ntp server 2001:0db8:010e::2 prefer
```

To stop using the time server at 2001:0db8:010e::2, use the commands:

```
awplus# configure terminal
awplus(config)# no ntp server 2001:0db8:010e::2
```

**Related  
commands**    [ntp peer](#)  
                  [ntp source](#)

# ntp source

**Overview** Use this command to configure an IPv4 or an IPv6 address for the NTP source interface. This command defines the socket used for NTP messages, and only applies to NTP client behavior.

Note that you cannot use this command when using AMF (Allied Telesis Management Framework) or VCStack.

Use the **no** variant of this command to remove the configured IPv4 or IPv6 address from the NTP source interface.

**Syntax** `ntp source <source-address>`  
`no ntp source`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>&lt;source-address&gt;</code> | Specify the IP address of the NTP source interface, entered in the form A.B.C.D for an IPv4 address, or in the form X:X::X.X for an IPv6 address. |

**Default** An IP address is selected based on the most appropriate egress interface used to reach the NTP peer if a configured NTP client source IP address is unavailable or invalid.

**Mode** Global Configuration

**Usage notes** Adding an IPv4 or an IPv6 address allows you to select which source interface NTP uses for peering. The IPv4 or IPv6 address configured using this command is matched to the interface.

When selecting a source IP address to use for NTP messages to the peer, if the configured NTP client source IP address is unavailable then default behavior will apply, and an alternative source IP address is automatically selected. This IP address is based on the most appropriate egress interface used to reach the NTP peer. The configured NTP client source IP may be unavailable if the interface is down, or an invalid IP address is configured that does not reside on the device.

Note that this command only applies to NTP client behavior. The egress interface that the NTP messages use to reach the NTP server is determined by the `ntp peer` and `ntp server` commands.

**Examples** To configure the NTP source interface with the IPv4 address 192.0.2.23, enter the commands:

```
awplus# configure terminal
awplus(config)# ntp source 192.0.2.23
```

To configure the NTP source interface with the IPv6 address 2001:0db8:010e::2, enter the commands:

```
awplus# configure terminal  
awplus(config)# ntp source 2001:0db8:010e::2
```

To remove a configured address for the NTP source interface, use the following commands:

```
awplus# configure terminal  
awplus(config)# no ntp source
```

**Related commands**

- [ntp peer](#)
- [ntp server](#)

# show ntp associations

**Overview** Use this command to display the status of NTP associations.

**Syntax** show ntp associations

**Mode** User Exec and Privileged Exec

**Example** See the sample output of the **show ntp associations** command displaying the status of NTP associations.

Table 65-1: Example output from **show ntp associations**

```
awplus#show ntp associations
remote          refid          st t when poll reach  delay  offset  disp
-----
*server1.example.com
                192.0.2.2      4 u  47  64  377  0.177  0.021  0.001
+192.168.1.10   10.32.16.80   5 u  46  64  377  0.241  -0.045 0.000
* system peer, # backup, + candidate, - outlier, x false ticker
```

Table 65-2: Parameters in the output from **show ntp associations**

| Parameter      | Description  |
|----------------|--|
| * system peer  | The peer that NTP uses to calculate variables like the offset and root dispersion of this AlliedWare Plus device. NTP passes these variables to the clients using this AlliedWare Plus device.   |
| # backup       | Peers that are usable, but are not among the first six peers sorted by synchronization distance. These peers may not be used.  |
| + candidate    | Peers that the NTP algorithm has determined can be used, along with the system peer, to discipline the clock (i.e. to set the time on the AlliedWare Plus device).   |
| - outlier      | Peers that are not used because their time is significantly different from the other peers.  |
| x false ticker | Peers that are not used because they are not consider trustworthy.   |
| space          | Peers that are not used because they are, for example, unreachable.  |
| remote         | The peer IP address  |
| refid          | The IP address of the reference clock, or an abbreviation indicating the type of clock (e.g. GPS indicates that the server uses GPS for the reference clock). INIT indicates that the reference clock is initializing, so it is not operational. |

Table 65-2: Parameters in the output from **show ntp associations** (cont.)

| Parameter | Description  |
|-----------|--|
| st        | The stratum, which is the number of hops between the server and the accurate time source such as an atomic clock.  |
| t         | Type, one of:<br>u: unicast or anycast client<br>b: broadcast or multicast client<br>l: local reference clock<br>s: symmetric peer<br>A: anycast server<br>B: broadcast server<br>M: multicast server  |
| when      | When last polled (seconds ago, h hours ago, or d days ago).  |
| poll      | Time between NTP requests from the device to the server.   |
| reach     | An indication of whether or not the NTP server is responding to requests. 0 indicates there has never been a successful poll; 1 indicates that the last poll was successful; 3 indicates that the last two polls were successful; 377 indicates that the last 8 polls were successful. |
| delay     | The round trip communication delay to the remote peer or server, in milliseconds.  |
| offset    | The mean offset (phase) in the times reported between this local host and the remote peer or server (root mean square, milliseconds).  |
| disp      | The amount of clock error (in milliseconds) of the server due to clock resolution, network congestion, etc.  |

# show ntp counters

**Overview** This command displays packet counters for NTP.

**Syntax** show ntp counters

**Mode** Privileged Exec

**Example** To display counters for NTP use the command:

```
awplus# show ntp counters
```

Figure 65-1: Example output from **show ntp counters**

```
awplus#show ntp counters
Server Received          4
Server Dropped           0
Client Sent              90
Client Received          76
Client Valid Received    76
```

Table 65-3: Parameters in the output from **show ntp counters**

| Parameter             | Description  |
|-----------------------|--|
| Server Received       | Number of NTP packets received from NTP clients.             |
| Server Dropped        | Number of NTP packets received from NTP clients but dropped. |
| Client Sent           | Number of NTP packets sent to servers.                       |
| Client Received       | Number of NTP packets received from servers                  |
| Client Valid Received | Number of valid NTP packets received from servers.           |

# show ntp counters associations

**Overview** Use this command to display NTP packet counters for individual servers and peers.

**Syntax** show ntp counters associations

**Mode** Privileged Exec

**Examples** To display packet counters for each NTP server and peer that is associated with a device, use the command:

```
awplus# show ntp counters associations
```

**Output** Figure 65-2: Example output from **show ntp counters associations**

```
awplus#show ntp counters associations
Peer 2001::1
  sent:          -
  received:      -
Peer 10.37.219.100
  sent:          7
  received:      7
```

Table 65-4: Parameters in the output from **show ntp counters associations**

| Parameter | Description  |
|-----------|--|
| Peer      | An NTP peer or server that the device is associated with.          |
| sent      | The number of NTP packets that this device sent to the peer.       |
| received  | The number of NTP packets that this device received from the peer. |

**Related commands** [ntp restrict](#)

# show ntp status

**Overview** Use this command to display the status of the Network Time Protocol (NTP).

**Syntax** show ntp status

**Mode** User Exec and Privileged Exec

**Example** To see information about NTP status, use the command:

```
awplus# show ntp status
```

For information about the output displayed by this command, see [ntp.org](http://ntp.org).

Figure 65-3: Example output from **show ntp status**

```
awplus#show ntp status

# SNMP Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure SNMP. For more information, see:

- the [Support for Allied Telesis Enterprise\\_MIBs in AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

- Command List**

# alias (interface)

**Overview** Use this command to set an alias name for a port, as returned by the SNMP ifMIB in OID 1.3.6.1.2.1.31.1.1.1.18.

Use the **no** variant of this command to remove an alias name from a port.

**Syntax** `alias <ifAlias>`  
`no alias`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;ifAlias&gt;</code> | 64 character name for an interface in a network management system. All printable characters are valid. |

**Default** Not set.

**Mode** Interface Configuration

**Usage notes** The interface alias can also be set via SNMP.

Third-party management systems often use standard MIBs to access device information. Network managers can specify an alias interface name to provide a non-volatile way to access the interface.

**Example** To configure the alias interface name 'uplink\_a' for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# alias uplink_a
```

To remove an alias interface name from port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no alias
```

**Command changes** Version 5.4.8-2.1: command added

# clear mac address-table notification mac-change

**Overview** Use this command to clear the MAC address table change history and counters. This command clears the change history and resets the counters to zero.

**Syntax** `clear mac address-table notification mac-change`

**Mode** User Exec

**Example** To clear the MAC address table change history and counters, use the command:

```
awplus# clear mac address-table notification mac-change
```

**Related commands** [mac address-table notification mac-change interval](#)  
[mac address-table notification mac-change history-size](#)  
[show mac address-table notification mac-change](#)  
[snmp trap mac-change](#)

**Command changes** Version 5.5.1-2.1: command added

# debug snmp

**Overview** This command enables SNMP debugging.

The **no** variant of this command disables SNMP debugging.

**Syntax**

```
debug snmp  
[all|detail|error-string|process|receive|send|xdump]  
  
no debug snmp  
[all|detail|error-string|process|receive|send|xdump]
```

| Parameter    | Description   |
|--------------|---|
| all          | Enable or disable the display of all SNMP debugging information.                          |
| detail       | Enable or disable the display of detailed SNMP debugging information.                     |
| error-string | Enable or disable the display of debugging information for SNMP error strings.            |
| process      | Enable or disable the display of debugging information for processed SNMP packets.        |
| receive      | Enable or disable the display of debugging information for received SNMP packets.         |
| send         | Enable or disable the display of debugging information for sent SNMP packets.             |
| xdump        | Enable or disable the display of hexadecimal dump debugging information for SNMP packets. |

**Mode** Privileged Exec and Global Configuration

**Example** To start SNMP debugging, use the command:

```
awplus# debug snmp
```

To start SNMP debugging, showing detailed SNMP debugging information, use the command:

```
awplus# debug snmp detail
```

To start SNMP debugging, showing all SNMP debugging information, use the command:

```
awplus# debug snmp all
```

**Related commands**

- [show debugging snmp](#)
- [terminal monitor](#)
- [undebug snmp](#)

# mac address-table notification mac-change

**Overview** Use this command to enable the mac-change history table. You also need to use the command `snmp trap mac-change` to set up the trap and `snmp-server enable trap` to enable the trap for transmission.

Use the **no** variant of this command to disable the mac-change history table.

**Syntax** `mac address-table notification mac-change`  
`no mac address-table notification mac-change`

**Default** Disabled

**Mode** Global Configuration

**Usage notes** To set up the mac-change trap use the command:

- `snmp trap mac-change`

To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- `snmp-server enable trap`

**Example** To enable the mac-change history table, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
```

**Related commands** `clear mac address-table notification mac-change`  
`mac address-table notification mac-change history-size`  
`mac address-table notification mac-change interval`  
`mac address-table notification mac-threshold`  
`show mac address-table notification mac-change`  
`snmp-server enable trap`  
`snmp trap mac-change`

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-change history-size

**Overview** Use this command to set the MAC address table history size to an upper limit on the number of entries that the SNMP table may contain.

Use the **no** variant of this command to set the history size back to the default (1).

**Syntax** `mac address-table notification mac-change history-size <0-500>`  
`no mac address-table notification mac-change history-size`

| Parameter                  | Description   |
|----------------------------|---|
| <code>&lt;0-500&gt;</code> | Set the upper limit on the number of entries that the SNMP MAC address table may contain. |

**Default** Table size is set at 1 entry.

**Mode** Global Configuration

**Usage notes** If the mac-change history table is not enabled, then the history size is stored for when it is enabled.

To enable the mac-change history table, use the command:

- `mac address-table notification mac-change`

**Example** To configure the size of the MAC change history table to 40, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
history-size 40
```

**Related commands**

- `clear mac address-table notification mac-change`
- `mac address-table notification mac-change`
- `mac address-table notification mac-change interval`
- `mac address-table notification mac-threshold`
- `show mac address-table notification mac-change`
- `snmp trap mac-change`

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-change interval

**Overview** Use this command to set the maximum time that a MAC change SNMP notification is delayed in the MAC address table.

Use the **no** variant of this command to set the interval back to the default (1).

**Syntax** `mac address-table notification mac-change interval <0-2147483647>`  
`no mac address-table notification mac-change interval`

| Parameter                         | Description                  |
|-----------------------------------|------------------------------|
| <code>&lt;0-2147483647&gt;</code> | Set the interval in seconds. |

**Default** Interval is set at 1 second.

**Mode** Global Configuration

**Usage notes** If the mac-change history table is not enabled, then the interval is stored for when it is enabled.

To enable the mac-change history table, use the command:

- [mac address-table notification mac-change](#)

**Example** To configure an interval of 5 seconds for the time between two MAC change SNMP notifications being sent, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-change
interval 5
```

**Related commands**

- [clear mac address-table notification mac-change](#)
- [mac address-table notification mac-change](#)
- [mac address-table notification mac-change history-size](#)
- [mac address-table notification mac-threshold](#)
- [show mac address-table notification mac-change](#)
- [snmp trap mac-change](#)

**Command changes** Version 5.5.1-2.1: command added

# mac address-table notification mac-threshold

**Overview** Use this command to change the default interval and threshold values for storing and sending Layer 2 forwarding database (FDB) utilization information. These settings are stored in the running configuration.

Use the **no** variant of this command to set the threshold configuration back to the default.

**Syntax** `mac address-table notification mac-threshold {interval <120-214783647>|limit <0-100>}`  
`no mac address-table notification mac-threshold`

| Parameter       | Description   |
|-----------------|---|
| interval        | Change the default interval value. The interval value controls the interval between utilization checks. |
| <120-214783647> | Set the interval in seconds.  |
| limit           | Change the limit value. When this limit is reached, an SNMP trap is sent.                               |
| <0-100>         | Set the limit as a percentage.  |

**Default** Interval default is 120 seconds and the limit default is 50 percent.

**Mode** Global Configuration

**Usage notes** To enable transmission of the mac-threshold trap, specify the parameter **mac-threshold**, use the command:

- `snmp-server enable trap`

**Example** To configure the MAC threshold notifications to be sent if the L2 FDB table utilization is more than or equal to 70%, use the commands:

```
awplus# configure terminal
awplus(config)# mac address-table notification mac-threshold
limit 70
```

To set the MAC threshold notifications interval and limit back to default values, use the commands:

```
awplus# configure terminal
awplus(config)# no mac address-table notification mac-threshold
```

**Related commands** `show running-config`  
`snmp-server enable trap`

**Command changes** Version 5.5.1-2.1: command added

# show counter snmp-server

**Overview** This command displays counters for SNMP messages received by the SNMP agent.

**Syntax** show counter snmp-server

**Mode** User Exec and Privileged Exec

**Example** To display the counters for the SNMP agent, use the command:

```
awplus# show counter snmp-server
```

**Output** Figure 66-1: Example output from the **show counter snmp-server** command

```

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter           | Meaning   |
|---------------------|---|
| inPkts              | The total number of SNMP messages received by the SNMP agent.   |
| inBadVersions       | The number of messages received by the SNMP agent for an unsupported SNMP version. It drops these messages. The SNMP agent on your device supports versions 1, 2C, and 3.   |
| inBadCommunityNames | The number of messages received by the SNMP agent with an unrecognized SNMP community name. It drops these messages.  |
| inBadCommunityUses  | The number of messages received by the SNMP agent where the requested SNMP operation is not permitted from SNMP managers using the SNMP community named in the message.   |
| inASNParseErrs      | The number of ASN.1 or BER errors that the SNMP agent has encountered when decoding received SNMP Messages.   |
| inTooBig            | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'tooBig'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.  |
| inNoSuchNames       | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'noSuchName'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.  |
| inBadValues         | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'badValue'. This is sent by an SNMP manager to indicate that an exception occurred when processing a request from the agent.  |
| inReadOnly          | The number of valid SNMP PDUs received by the SNMP agent where the value of the error-status field is 'readOnly'. The SNMP manager should not generate a PDU which contains the value 'readOnly' in the error-status field. This indicates that there is an incorrect implementation of the SNMP. |
| inGenErrs           | The number of SNMP PDUs received by the SNMP agent where the value of the error-status field is 'genErr'.   |

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter      | Meaning  |
|----------------|--|
| inTotalReqVars | The number of MIB objects that the SNMP agent has successfully retrieved after receiving valid SNMP Get-Request and Get-Next PDUs.   |
| inTotalSetVars | The number of MIB objects that the SNMP agent has successfully altered after receiving valid SNMP Set-Request PDUs.  |
| inGetRequests  | The number of SNMP Get-Request PDUs that the SNMP agent has accepted and processed.  |
| inGetNexts     | The number of SNMP Get-Next PDUs that the SNMP agent has accepted and processed.   |
| inSetRequests  | The number of SNMP Set-Request PDUs that the SNMP agent has accepted and processed.  |
| inGetResponses | The number of SNMP Get-Response PDUs that the SNMP agent has accepted and processed.   |
| inTraps        | The number of SNMP Trap PDUs that the SNMP agent has accepted and processed.   |
| outPkts        | The number of SNMP Messages that the SNMP agent has sent.  |
| outTooBig      | The number of SNMP PDUs that the SNMP agent has generated with the value 'tooBig' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outNoSuchNames | The number of SNMP PDUs that the SNMP agent has generated with the value 'noSuchName' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager. |
| outBadValues   | The number of SNMP PDUs that the SNMP agent has generated with the value 'badValue' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.   |
| outGenErrs     | The number of SNMP PDUs that the SNMP agent has generated with the value 'genErr' in the error-status field. This is sent to the SNMP manager to indicate that an exception occurred when processing a request from the manager.     |
| outGetRequests | The number of SNMP Get-Request PDUs that the SNMP agent has generated.   |

**Table 1:** Parameters in the output of the **show counter snmp-server** command

| Parameter                 | Meaning   |
|---------------------------|---|
| outGetNexts               | The number of SNMP Get-Next PDUs that the SNMP agent has generated.   |
| outSetRequests            | The number of SNMP Set-Request PDUs that the SNMP agent has generated.  |
| outGetResponses           | The number of SNMP Get-Response PDUs that the SNMP agent has generated.   |
| outTraps                  | The number of SNMP Trap PDUs that the SNMP agent has generated.   |
| UnsupportedSecurityLevels | The number of received packets that the SNMP agent has dropped because they requested a securityLevel unknown or not available to the SNMP agent. |
| NotInTimeWindows          | The number of received packets that the SNMP agent has dropped because they appeared outside of the authoritative SNMP agent's window.            |
| UnknownUserNames          | The number of received packets that the SNMP agent has dropped because they referenced an unknown user.   |
| UnknownEngineIDs          | The number of received packets that the SNMP agent has dropped because they referenced an unknown snmpEngineID.                                   |
| WrongDigest               | The number of received packets that the SNMP agent has dropped because they didn't contain the expected digest value.                             |
| DecryptionErrors          | The number of received packets that the SNMP agent has dropped because they could not be decrypted.   |
| UnknownSecModels          | The number of messages received that contain a security model that is not supported by the server. Valid for SNMPv3 messages only.                |
| InvalidMsgs               | The number of messages received where the security model is supported but the authentication fails. Valid for SNMPv3 messages only.               |
| UnknownPDUHandlers        | The number of times the SNMP handler has failed to process a PDU. This is a system debugging counter.   |

**Related commands** [show snmp-server](#)

# show debugging snmp

**Overview** This command displays whether SNMP debugging is enabled or disabled.

**Syntax** `show debugging snmp`

**Mode** User Exec and Privileged Exec

**Example** To display the status of SNMP debugging, use the command:

```
awplus# show debugging snmp
```

**Output** Figure 66-2: Example output from the **show debugging snmp** command

```
Sntp (SMUX) debugging status:  
Sntp debugging is on
```

**Related commands** [debug snmp](#)

# show mac address-table notification mac-change

**Overview** Use this command to show the MAC change configuration. It includes the MAC change history.

**Syntax** show mac address-table notification mac-change

**Mode** User Exec

**Example** To show the MAC change configuration and history, use the command:

```
awplus# show mac address-table notification mac-change
```

**Output** Figure 66-3: Example output from **show mac address-table notification mac-change**

```
awplus#show mac address-table notification mac-change
MAC Change Feature: Enabled
MAC Change Notification Traps: Enabled
Wait time for MAC Change Notification Traps: 1 seconds
Number of MAC Address Add events: 1
Number of MAC Address Remove events: 0
Number of MAC Change Notification Traps sent: 1
Maximum Number of entries configured in History Table: 1
Number of entries currently in History Table: 1
History Table contents

```

Table 66-1: Parameters in the output from **show mac address-table notification mac-change**

| Parameter                                   | Description  |
|---|--|
| MAC Change Feature                          | Displays if the feature is enabled or not. If this is disabled, then no more MAC change events will be generated, no events are added to the history, and no traps are logged.                           |
| MAC Change Notification Traps               | Displays if MAC change traps are sent when MAC change events are generated. This only affects traps, (MAC change history is not affected).   |
| Wait time for MAC Change Notification Traps | The maximum time a MAC change event waits before a MAC change trap is sent. This is also the maximum time a MAC change event waits before being added to the MAC change history. The time is in seconds. |

Table 66-1: Parameters in the output from **show mac address-table notification mac-change** (cont.)

| Parameter   | Description  |
|---|--|
| Number of MAC Address Add events                      | The number of MAC-added events processed by the feature.       |
| Number of MAC Address Remove events                   | The number of MAC-removed events processed by the feature.     |
| Number of MAC Change Notification Traps sent          | The number of MAC notification traps sent by the feature.      |
| Maximum Number of entries configured in History Table | The maximum number of entries present in the MAC change table. |

[snmp-server view](#)

# snmp trap mac-change

**Overview** Use this command to enable the MAC notification feature to apply mac-change notifications via the mac-change trap. This command configures the trap so that you are notified when MAC addresses are added or removed from the forwarding database (FDB). This is applied to interfaces via a specified port or a range of ports.

Use the **no** variant of this command to disable the MAC notification feature.

**Syntax** `snmp trap mac-change {[add] [remove]}`  
`no snmp trap mac-change [add] [remove]`

| Parameter | Description   |
|-----------|---|
| add       | Enable SNMP mac-change traps when a MAC address is added.   |
| remove    | Enable SNMP mac-change traps when a MAC address is removed. |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** To enable transmission of the mac-change trap, specify the parameter **mac-change**, use the command:

- [snmp-server enable trap](#)

To enable the mac-change history table, use the command:

- [mac address-table notification mac-change](#)

**Example** To get mac-change notifications whenever a MAC address associated with port1.0.1 is added or removed from the FDB table, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# snmp trap mac-change add remove
```

**Related commands** [clear mac address-table notification mac-change](#)  
[mac address-table notification mac-change](#)  
[show interface](#)  
[snmp-server enable trap](#)

**Command changes** Version 5.5.1-2.1: command added

# snmp trap link-status

**Overview** Use this command to enable SNMP to send link status notifications (traps) for the interfaces when an interface goes up (linkUp) or down (linkDown).

Use the **no** variant of this command to disable the sending of link status notifications.

**Syntax** `snmp trap link-status [enterprise]`  
`no snmp trap link-status`

| Parameter  | Description  |
|------------|--|
| enterprise | Send an Allied Telesis enterprise type of link trap. |

**Default** Disabled

**Mode** Interface Configuration

**Usage notes** The link status notifications can be enabled for the following interface types:

- switch port (e.g. port1.0.1)
- VLAN (e.g. vlan2)
- static and dynamic link aggregation (e.g. sa2, po2)

To specify where notifications are sent, use the [snmp-server host](#) command. To configure the device globally to send other notifications, use the [snmp-server enable trap](#) command.

**Examples** To enable SNMP to send link status notifications for port1.0.1 to port1.0.3 use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status
```

To disable the sending of link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status
```

**Related commands** [show interface](#)  
[snmp trap link-status suppress](#)  
[snmp-server enable trap](#)  
[snmp-server host](#)

# snmp trap link-status suppress

**Overview** Use this command to enable the suppression of link status notifications (traps) for the interfaces beyond the specified threshold, in the specified interval.

Use the **no** variant of this command to disable the suppression of link status notifications for the ports.

**Syntax** `snmp trap link-status suppress {time {<1-60>|default}|threshold {<1-20>|default}}`

`no snmp trap link-status suppress`

| Parameter | Description   |
|-----------|---|
| time      | Set the suppression timer for link status notifications.  |
| <1-60>    | The suppress time in seconds.   |
| default   | The default suppress time in seconds (60).  |
| threshold | Set the suppression threshold for link status notifications. This is the number of link status notifications after which to suppress further notifications within the suppression timer interval. |
| <1-20>    | The number of link status notifications.  |
| default   | The default number of link status notifications (20).   |

**Default** By default, if link status notifications are enabled (they are enabled by default), the suppression of link status notifications is enabled: notifications that exceed the notification threshold (default 20) within the notification timer interval (default 60 seconds) are not sent.

**Mode** Interface Configuration

**Usage notes** An unstable network can generate many link status notifications. When notification suppression is enabled, a suppression timer is started when the first link status notification of a particular type (linkUp or linkDown) is sent for an interface.

If the threshold number of notifications of this type is sent before the timer reaches the suppress time, any further notifications of this type generated for the interface during the interval are not sent. At the end of the interval, the sending of link status notifications resumes, until the threshold is reached in the next interval.

**Examples** To suppress link status notifications for port1.0.1 to port1.0.3 after 10 notifications in 40 seconds, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1-port1.0.3
awplus(config-if)# snmp trap link-status suppress time 40
threshold 10
```

To stop suppressing link status notifications for port1.0.1, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no snmp trap link-status suppress
```

**Related commands**

- [show interface](#)
- [snmp trap link-status](#)

# snmp-server

**Overview** Use this command to enable the SNMP agent (server) on the device. The SNMP agent receives and processes SNMP packets sent to the device, and generates notifications (traps) that have been enabled by the [snmp-server enable trap](#) command.

Use the **no** variant of this command to disable the SNMP agent on the device. When SNMP is disabled, SNMP packets received by the device are discarded, and no notifications are generated. This does not remove any existing SNMP configuration.

**Syntax** `snmp-server [ip|ipv6]`  
`no snmp-server [ip|ipv6]`

| Parameter | Description                                |
|-----------|--|
| ip        | Enable or disable the SNMP agent for IPv4. |
| ipv6      | Enable or disable the SNMP agent for IPv6. |

**Default** By default, the SNMP agent is enabled for both IPv4 and IPv6. If neither the **ip** parameter nor the **ipv6** parameter is specified for this command, then SNMP is enabled or disabled for both IPv4 and IPv6.

**Mode** Global Configuration

**Examples** To enable SNMP on the device for both IPv4 and IPv6, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-server
```

To enable the SNMP agent for IPv4 on the device, use the commands:

```
awplus# configure terminal  
awplus(config)# snmp-server ip
```

To disable the SNMP agent for both IPv4 and IPv6 on the device, use the commands:

```
awplus# configure terminal  
awplus(config)# no snmp-server
```

To disable the SNMP agent for IPv4, use the commands:

```
awplus(config)# no snmp-server ipv4
```

**Related commands**

- snmp-server location
- snmp-server view

# snmp-server community

**Overview** This command creates an SNMP community, optionally setting the access mode for the community. The default access mode is read-only. If view is not specified, the community allows access to all the MIB objects. The SNMP communities are only valid for SNMPv1 and v2c and provide very limited security. Communities should not be used when operating SNMPv3.

The **no** variant of this command removes an SNMP community. The specified community must already exist on the device.

**Syntax** `snmp-server community <community-name> {view <view-name>|ro|rw|<access-list>}`  
`no snmp-server community <community-name>`

| Parameter        | Description  |
|------------------|--|
| <community-name> | Community name. The community name is a case sensitive string of up to 20 characters.              |
| view             | Configure SNMP view. If view is not specified, the community allows access to all the MIB objects. |
| <view-name>      | View name. The view name is a string up to 20 characters long and is case sensitive.               |
| ro               | Read-only community.   |
| rw               | Read-write community.  |
| <access-list>    | <1-99> Access list number.   |

**Mode** Global Configuration

**Example** Use the following commands to create an SNMP community called 'public' with read-only access to all MIB variables from any management station:

```
awplus# configure terminal  
awplus(config)# snmp-server community public ro
```

Use the following commands to remove an SNMP community called 'public'

```
awplus# configure terminal  
awplus(config)# no snmp-server community public
```

**Related commands** [show snmp-server](#)  
[show snmp-server community](#)  
[snmp-server view](#)

# snmp-server contact

**Overview** This command sets the contact information for the system. The contact name is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysContact

The **no** variant of this command removes the contact information from the system.

**Syntax** `snmp-server contact <contact-info>`  
`no snmp-server contact`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;contact-info&gt;</code> | The contact information for the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the system contact information to "support@alliedtelesis.co.nz", use the command:

```
awplus# configure terminal
awplus(config)# snmp-server contact
support@alliedtelesis.co.nz
```

**Related commands** [show system](#)  
[snmp-server location](#)  
[snmp-server group](#)

# snmp-server enable trap

**Overview** Use this command to enable the transmission of the specified notifications (traps) on your device.

Note that the Environmental Monitoring traps defined in the AT-ENVMONv2-MIB are enabled by default.

Use the **no** variant of this command to disable the transmission of the specified notifications.

**Syntax** `snmp-server enable trap <trap-list>`  
`no snmp-server enable trap <trap-list>`

Depending on your device model, you can enable some or all of the traps in the following table:

| Parameter     | Description  |
|---------------|--|
| atmf          | AMF traps.   |
| atmfguestnode | AMF guest node traps.  |
| atmflink      | AMF link traps.  |
| atmfnode      | AMF node traps.  |
| atmfrr        | AMF reboot-rolling traps.  |
| auth          | Authentication failure.  |
| bgp           | BGP traps.   |
| chassis       | Chassis traps.   |
| cwmap         | Access Point traps with the AWC wireless manager.  |
| dhcpsnooping  | DHCP snooping and ARP security traps. These notifications must also be set using the <b>ip dhcp snooping violation</b> command, and/or the arp security violation <b>arp security violation</b> command. |
| epsr          | EPSR traps.  |
| g8032         | G.8032 ERP traps.  |
| lldp          | Link Layer Discovery Protocol (LLDP) traps. These notifications must also be enabled using the <b>lldp notifications</b> command, and/or the <b>lldp med-notifications</b> command.                      |
| loopprot      | Loop Protection traps.   |
| mac-change    | MAC address changed.   |
| mac-move      | MAC address moved between interface.   |
| mac-threshold | MAC address table reaches a threshold limit.   |
| mstp          | MSTP traps.  |

| Parameter    | Description                                       |
|--------------|---|
| nsm          | NSM traps.  |
| ospf         | OSPF traps.                                       |
| pim          | PIM traps.  |
| power-inline | Power-inline traps (Power Ethernet MIB RFC 3621). |
| qsp          | QoS Storm Protection.                             |
| rmon         | RMON traps.                                       |
| thrash-limit | MAC address Thrash Limiting traps.                |
| vcs          | VCS traps.  |
| vrrp         | Virtual Router Redundancy (VRRP) traps.           |
| ufo          | Upstream Forwarding Only (UFO) traps.             |

**Default** Disabled

**Mode** Global Configuration

**Usage notes** This command cannot be used to enable link status notifications globally. To enable link status notifications for particular interfaces, use the [snmp trap link-status](#) command.

To specify where notifications are sent, use the [snmp-server host](#) command.

Note that you can enable (or disable) multiple traps with a single command, by specifying a space-separated list of traps.

**Examples** To enable the device to send a notification if an AMF node changes its status, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap atmfnode
```

To enable the device to send MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap thrash-limit
```

To disable the device from sending MAC address Thrash Limiting traps, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server enable trap thrash-limit
```

To enable the device to send OSPF and VRRP-related traps, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server enable trap ospf vrrp
```

To disable OSPF traps being sent out by the device, use the following commands:

```
awplus# configure terminal  
awplus(config)# no snmp-server enable trap ospf
```

**Related  
commands**

`show snmp-server`  
`show ip dhcp snooping`  
`snmp trap link-status`  
`snmp-server host`

**Command  
changes**

Version 5.4.7-2.1: **ufo** parameter added  
Version 5.5.1-1.1: **atmfguestnode** and **cwmap** parameters added  
Version 5.5.1-2.1: **mac-change**, **mac-move**, and **mac-threshold** parameters added

# snmp-server engineID local

**Overview** Use this command to configure the SNMPv3 engine ID. The SNMPv3 engine ID is used to uniquely identify the SNMPv3 agent on a device when communicating with SNMP management clients. Once an SNMPv3 engine ID is assigned, this engine ID is permanently associated with the device until you change it.

Use the **no** variant of this command to set the user defined SNMPv3 engine ID to a system generated pseudo-random value by resetting the SNMPv3 engine. The **no snmp-server engineID local** command has the same effect as the **snmp-server engineID local default** command.

Note that the [snmp-server engineID local reset](#) command is used to force the system to generate a new engine ID when the current engine ID is also system generated.

**Syntax** `snmp-server engineID local {<engine-id>|default}`  
`no snmp-server engineID local`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>&lt;engine-id&gt;</code> | Specify SNMPv3 Engine ID value, a string of up to 27 characters.   |
| <code>default</code>           | Set SNMPv3 engine ID to a system generated value by resetting the SNMPv3 engine, provided the current engine ID is user defined. If the current engine ID is system generated, use the <a href="#">snmp-server engineID local reset</a> command to force the system to generate a new engine ID. |

**Mode** Global Configuration

**Usage notes** All devices must have a unique engine ID which is permanently set unless it is configured by the user.

In a stacked environment, if the same engine ID was automatically generated for all members of the stack, conflicts would occur if the stack was dismantled. Therefore, each member of the stack will generate its own engine ID and the stack master's ID is used when transmitting SNMPv3 packets. Should a master failover occur, a different engine ID is transmitted. You can modify this behavior by manually assigning all stack members the same engine ID using the [snmp-server engineID local](#) command. However, should you decide to separate the stack and use the devices individually, you must remember to change or remove this configuration to prevent conflicts.

**Example** To set the SNMPv3 engine ID to 800000cf030000cd123456, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local
800000cf030000cd123456
```

To set a user defined SNMPv3 engine ID back to a system generated value, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server engineID local
```

**Output** The following example shows the engine ID values after configuration:

```
awplus(config)#snmp-server engineid local asdgdfh231234d
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... asdgdfh231234d
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483

awplus(config)#no snmp-server engineid local
awplus(config)#exit
awplus#show snmp-server

SNMP Server ..... Enabled
IP Protocol ..... IPv4
SNMPv3 Engine ID (configured name) ... Not set
SNMPv3 Engine ID (actual) ..... 0x80001f888029af52e149198483
```

**Related commands** [show snmp-server](#)  
[snmp-server engineID local reset](#)  
[snmp-server group](#)

# snmp-server engineID local reset

**Overview** Use this command to force the device to generate a new pseudo-random SNMPv3 engine ID by resetting the SNMPv3 engine. If the current engine ID is user defined, use the [snmp-server engineID local](#) command to set SNMPv3 engine ID to a system generated value.

**Syntax** `snmp-server engineID local reset`

**Mode** Global Configuration

**Example** To force the SNMPv3 engine ID to be reset to a system generated value, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server engineID local reset
```

**Related commands** [snmp-server engineID local](#)  
[show snmp-server](#)

# snmp-server group

**Overview** This command is used with SNMP version 3 only, and adds an SNMP group, optionally setting the security level and view access modes for the group. The security and access views defined for the group represent the minimum required of its users in order to gain access.

The **no** variant of this command deletes an SNMP group, and is used with SNMPv3 only. The group with the specified authentication/encryption parameters must already exist.

**Syntax** `snmp-server group <groupname> {auth|noauth|priv} [read <readname>|write <writename>|notify <notifyname>]`  
`no snmp-server group <groupname>`

| Parameter    | Description   |
|--------------|---|
| <groupname>  | Group name. The group name is a string up to 20 characters long and is case sensitive.      |
| auth         | Authentication.   |
| noauth       | No authentication and no encryption.  |
| priv         | Authentication and encryption.  |
| read         | Configure read view.  |
| <readname>   | Read view name.   |
| write        | Configure write view.   |
| <writename>  | Write view name. The view name is a string up to 20 characters long and is case sensitive.  |
| notify       | Configure notify view.  |
| <notifyname> | Notify view name. The view name is a string up to 20 characters long and is case sensitive. |

**Mode** Global Configuration

**Examples** To add SNMP group, for ordinary users, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server group usergroup noauth read
useraccess write useraccess
```

To delete the SNMP group called 'usergroup', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server group usergroup
```

**Related  
commands**

- snmp-server
- show snmp-server
- show snmp-server group
- show snmp-server user

# snmp-server host

**Overview** This command specifies an SNMP trap host destination to which Trap or Inform messages generated by the device are sent.

For SNMP version 1 and 2c you must specify the community name parameter. For SNMP version 3, specify the authentication/encryption parameters and the user name. If the version is not specified, the default is SNMP version 1. Inform messages can be sent instead of traps for SNMP version 2c and 3.

Use the **no** variant of this command to remove an SNMP trap host. The trap host must already exist.

The trap host is uniquely identified by:

- host IP address (IPv4 or IPv6),
- inform or trap messages,
- community name (SNMPv1 or SNMP v2c) or the authentication/encryption parameters and user name (SNMP v3).

**Syntax**

```
snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>

no snmp-server host {<ipv4-address>|<ipv6-address>} [traps]
[version 1] <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 2c <community-name>

no snmp-server host {<ipv4-address>|<ipv6-address>}
[informs|traps] version 3 {auth|noauth|priv} <user-name>
```

| Parameter      | Description  |
|----------------|--|
| <ipv4-address> | IPv4 trap host address in the format A . B . C . D, for example, 192.0.2.2.            |
| <ipv6-address> | IPv6 trap host address in the format x : x : : x : x for example, 2001:db8::8a2e:7334. |
| informs        | Send Inform messages to this host.   |
| traps          | Send Trap messages to this host (default).   |
| version        | SNMP version to use for notification messages. Default: version 1.                     |
| 1              | Use SNMPv1 (default).  |
| 2c             | Use SNMPv2c.   |
| 3              | Use SNMPv3.  |

| Parameter        | Description                           |
|------------------|---------------------------------------|
| auth             | Authentication.                       |
| noauth           | No authentication.                    |
| priv             | Encryption.                           |
| <community-name> | The SNMPv1 or SNMPv2c community name. |
| <user-name>      | SNMPv3 user name.                     |

**Mode** Global Configuration

**Examples** To configure the device to send generated traps to the IPv4 host destination 192.0.2.5 with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host version 2c public192.0.2.5
```

To configure the device to send generated traps to the IPv6 host destination 2001:db8::8a2e:7334 with the SNMPv2c community name private, use the following command:

```
awplus# configure terminal
awplus(config)# snmp-server host version 2c
private2001:db8::8a2e:7334
```

To remove a configured trap host of 192.0.2.5 with the SNMPv2c community name public, use the following command:

```
awplus# configure terminal
awplus(config)# no snmp-server host version 2c public192.0.2.5
```

**Related commands**

- [snmp-server enable trap](#)
- [snmp-server view](#)

# snmp-server legacy-ifadminstatus

**Overview** Use this command to set the ifAdminStatus to reflect the operational state of the interface, rather than the administrative state.

The **no** variant of this command sets the ifAdminStatus to reflect the administrative state of the interface.

**Syntax** `snmp-server legacy-ifadminstatus`  
`no snmp-server legacy-ifadminstatus`

**Default** Legacy ifAdminStatus is turned off by default, so by default the SNMP ifAdminStatus reflects the administrative state of the interface.

**Mode** Global Configuration

**Usage notes** Note that if you enable Legacy ifAdminStatus, the ifAdminStatus will report a link's status as Down when the link has been blocked by a process such as loop protection.

**Example** To turn on Legacy ifAdminStatus, use the commands:

```
awplus# configure terminal
awplus(config)# snmp-server legacy-ifadminstatus
```

**Related commands** [show interface](#)

# snmp-server location

**Overview** This command sets the location of the system. The location is:

- displayed in the output of the [show system](#) command
- stored in the MIB object sysLocation

The **no** variant of this command removes the configured location from the system.

**Syntax** `snmp-server location <location-name>`  
`no snmp-server location`

| Parameter                          | Description   |
|------------------------------------|---|
| <code>&lt;location-name&gt;</code> | The location of the system, from 0 to 255 characters long. Valid characters are any printable character and spaces. |

**Mode** Global Configuration

**Example** To set the location to “server room 523”, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server location server room 523
```

**Related commands** [show snmp-server](#)  
[show system](#)  
[snmp-server contact](#)

# snmp-server source-interface

**Overview** Use this command to specify the originating interface for SNMP traps or informs. An interface specified by this command must already have an IP address assigned to it.

Use the **no** variant of this command to reset the interface to its default value (the originating egress interface).

**Syntax** `snmp-server source-interface {traps|informs} <interface-name>`  
`no snmp-server source-interface {traps|informs}`

| Parameter        | Description  |
|------------------|--|
| traps            | SNMP traps.  |
| informs          | SNMP informs.  |
| <interface-name> | Interface name (must already have an IP address assigned). |

**Default** The originating egress interface of the traps and informs messages

**Mode** Global Configuration

**Usage notes** When an SNMP server sends an SNMP trap or inform message, the message carries the notification IP address of its originating interface. Use this command to assign this interface.

**Example** The following commands set vlan2 to be the interface whose IP address is used as the originating address in SNMP informs packets.

```
awplus# configure terminal
awplus(config)# snmp-server source-interface informs vlan2
```

The following commands reset the originating source interface for SNMP trap messages to be the default interface (the originating egress interface):

```
awplus# configure terminal
awplus(config)# no snmp-server source-interface traps
```

**Validation Commands** `show running-config`

# snmp-server startup-trap-delay

**Overview** Use this command to set the time in seconds after following completion of the device startup sequence before the device sends any SNMP traps (or SNMP notifications).

Use the no variant of this command to restore the default startup delay of 30 seconds.

**Syntax** `snmp-server startup-trap-delay <delay-time>`  
`no snmp-server startup-trap-delay`

| Parameter                       | Description   |
|---------------------------------|---|
| <code>&lt;delay-time&gt;</code> | Specify an SNMP trap delay time in seconds in the range of 30 to 600 seconds. |

**Default** The SNMP server trap delay time is 30 seconds. The no variant restores the default.

**Mode** Global Configuration

**Example** To delay the device sending SNMP traps until 60 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server startup-trap-delay 60
```

To restore the sending of SNMP traps to the default of 30 seconds after device startup, use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server startup-trap-delay
```

**Validation Commands** `show snmp-server`

## snmp-server user

**Overview** Use this command to create or move users as members of specified groups. This command is used with SNMPv3 only.

The **no** variant of this command removes an SNMPv3 user. The specified user must already exist.

**Syntax** `snmp-server user <username> <groupname> [encrypted] [auth {md5|sha|sha-256} <auth-password>] [priv {des|aes} <privacy-password>]`  
`no snmp-server user <username>`

| Parameter          | Description  |
|--------------------|--|
| <username>         | User name. The user name is a string up to 20 characters long and is case sensitive.                   |
| <groupname>        | Group name. The group name is a string up to 20 characters long and is case sensitive.                 |
| encrypted          | Use the encrypted parameter when you want to enter encrypted passwords.                                |
| auth               | Authentication protocol.   |
| md5                | MD5 Message Digest Algorithms.   |
| sha                | SHA Secure Hash Algorithm.   |
| sha-256            | SHA-256 Secure Hash Algorithm. Note: SHA-256 authentication is required in crypto secure-mode.         |
| <auth-password>    | Authentication password. The password is a string of 8 to 20 characters long and is case sensitive.    |
| priv               | Privacy protocol.  |
| des                | DES: Data Encryption Standard. DES is not available if you enable <a href="#">crypto secure-mode</a> . |
| aes                | AES: Advanced Encryption Standards.  |
| <privacy-password> | Privacy password. The password is a string of 8 to 20 characters long and is case sensitive.           |

**Mode** Global Configuration

**Usage notes** Additionally this command provides the option of selecting an authentication protocol and (where appropriate) an associated password. Similarly, options are offered for selecting a privacy protocol and password.

- Note that each SNMP user must be configured on both the manager and agent entities. Where passwords are used, these passwords must be the same for both entities.

- Use the **encrypted** parameter when you want to enter already encrypted passwords in encrypted form as displayed in the running and startup configs stored on the device. For example, you may need to move a user from one group to another group and keep the same passwords for the user instead of removing the user to apply new passwords.
- User passwords are entered using plaintext without the **encrypted** parameter and are encrypted according to the authentication and privacy protocols selected.
- User passwords are viewed as encrypted passwords in running and startup configs shown from **show running-config** and **show startup-config** commands respectively. Copy and paste encrypted passwords from running-configs or startup-configs to avoid entry errors.

**Examples** To add SNMP user authuser as a member of group 'usergroup', with authentication protocol MD5, authentication password 'Authpass', privacy protocol AES and privacy password 'Privpass' use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser usergroup auth md5
Authpass priv aes Privpass
```

Validate the user is assigned to the group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name                Group name          Auth                Privacy
-----            -
authuser            usergroup           md5                 aes
```

To enter existing SNMP user 'authuser' with existing passwords as a member of group 'newusergroup' with authentication protocol MD5 with the encrypted authentication password 0x1c74b9c22118291b0ce0cd883f8dab6b74, and privacy protocol AES with the encrypted privacy password 0x0e0133db5453ebd03822b004eeacb6608f, use the following commands:

```
awplus# configure terminal
awplus(config)# snmp-server user authuser newusergroup
encrypted auth md5 0x1c74b9c22118291b0ce0cd883f8dab6b74 priv
aes 0x0e0133db5453ebd03822b004eeacb6608f
```

**NOTE:** Copy and paste the encrypted passwords from the **running-config** or the **startup-config** displayed, using the **show running-config** and **show startup-config** commands respectively, into the command line to avoid key stroke errors issuing this command.

Validate the user has been moved from the first group using the **show snmp-server user** command:

```
awplus#show snmp-server user
Name          Group name      Auth           Privacy
-----
authuser      newusergroup    md5            aes
```

To delete SNMP user 'authuser', use the following commands:

```
awplus# configure terminal
awplus(config)# no snmp-server user authuser
```

**Related commands**

- [show snmp-server user](#)
- [snmp-server view](#)

# snmp-server view

**Overview** Use this command to create an SNMP view that specifies a sub-tree of the MIB. Further sub-trees can then be added by specifying a new OID to an existing view. Views can be used in SNMP communities or groups to control the remote manager's access.

**NOTE:** The object identifier must be specified in a sequence of integers separated by decimal points.

The **no** variant of this command removes the specified view on the device. The view must already exist.

**Syntax** `snmp-server view <view-name> <mib-name> {included|excluded}`  
`no snmp-server view <view-name>`

| Parameter   | Description   |
|-------------|---|
| <view-name> | SNMP server view name.<br>The view name is a string up to 20 characters long and is case sensitive. |
| <mib-name>  | Object identifier of the MIB.   |
| included    | Include this OID in the view.   |
| excluded    | Exclude this OID in the view.   |

**Mode** Global Configuration

**Examples** The following command creates a view called "loc" that includes the system location MIB sub-tree.

```
awplus(config)# snmp-server view loc 1.3.6.1.2.1.1.6.0 included
```

To remove the view "loc" use the following command

```
awplus(config)# no snmp-server view loc
```

# undebbug snmp

**Overview** This command applies the functionality of the no `debug snmp` command.

# 67

# LLDP Commands

## Introduction

**Overview** LLDP and LLDP-MED can be configured using the commands in this chapter, or by using SNMP with the LLDP-MIB and LLDP-EXT-DOT1-MIB (see the [Support for Allied Telesis Enterprise MIBs in AlliedWare Plus](#)).

The Voice VLAN feature can be configured using commands in [VLAN Commands](#) chapter.

For more information about LLDP, see the [LLDP Feature Overview and Configuration Guide](#).

LLDP can transmit a lot of data about the network. Typically, the network information gathered using LLDP is transferred to a Network Management System by SNMP. For security reasons, we recommend using SNMPv3 for this purpose (see the [SNMP Feature Overview and Configuration Guide](#)).

LLDP operates over physical ports only. For example, it can be configured on switch ports that belong to static or dynamic channel groups, but not on the channel groups themselves.

# clear lldp statistics

**Overview** This command clears all LLDP statistics (packet and event counters) associated with specified ports. If no port list is supplied, LLDP statistics for all ports are cleared.

**Syntax** `clear lldp statistics [interface <port-list>]`

| Parameter   | Description   |
|-------------|---|
| <port-list> | The ports for which the statistics are to be cleared. |

**Mode** Privileged Exec

**Examples** To clear the LLDP statistics on ports 1.0.1 and 1.0.6, use the command:

```
awplus# clear lldp statistics interface port1.0.1,port1.0.6
```

To clear all LLDP statistics for all ports, use the command:

```
awplus# clear lldp statistics
```

**Related commands** [show lldp statistics](#)  
[show lldp statistics interface](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# clear lldp table

**Overview** This command clears the table of LLDP information received from neighbors through specified ports. If no port list is supplied, neighbor information is cleared for all ports.

**Syntax** `clear lldp table [interface <port-list>]`

| Parameter   | Description  |
|-------------|--|
| <port-list> | The ports for which the neighbor information table is to be cleared. |

**Mode** Privileged Exec

**Examples** To clear the table of neighbor information received on ports 1.0.1 and 1.0.6, use the command:

```
awplus# clear lldp table interface port1.0.1,port1.0.6
```

To clear the entire table of neighbor information received through all ports, use the command:

```
awplus# clear lldp table
```

**Related commands** [show lldp neighbors](#)

# debug lldp

**Overview** This command enables specific LLDP debug for specified ports. When LLDP debugging is enabled, diagnostic messages are entered into the system log. If no port list is supplied, the specified debugging is enabled for all ports.

The **no** variant of this command disables specific LLDP debug for specified ports. If no port list is supplied, the specified debugging is disabled for all ports.

**Syntax** debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
debug lldp operation  
no debug lldp {[rx][rxpkt][tx][txpkt]} [interface [<port-list>]]  
no debug lldp operation  
no debug lldp all

| Parameter   | Description                                      |
|-------------|--|
| rx          | LLDP receive debug.                              |
| rxpkt       | Raw LLDPDUs received in hex format.              |
| tx          | LLDP transmit debug.                             |
| txpkt       | Raw Tx LLDPDUs transmitted in hex format.        |
| <port-list> | The ports for which debug is to be configured.   |
| operation   | Debug for LLDP internal operation on the switch. |
| all         | Disables all LLDP debugging for all ports.       |

**Default** By default no debug is enabled for any ports.

**Mode** Privileged Exec

**Examples** To enable debugging of LLDP receive on ports 1.0.1 and 1.0.6, use the command:

```
awplus# debug lldp rx interface port1.0.1,port1.0.6
```

To enable debugging of LLDP transmit with packet dump on all ports, use the command:

```
awplus# debug lldp tx txpkt
```

To disable debugging of LLDP receive on ports 1.0.1 and 1.0.6, use the command:

```
awplus# no debug lldp rx interface port1.0.1,port1.0.6
```

To turn off all LLDP debugging on all ports, use the command:

```
awplus# no debug lldp all
```

**Related  
commands** show debugging lldp  
show running-config lldp  
terminal monitor

# lldp faststart-count

**Overview** Use this command to set the fast start count for LLDP-MED. The fast start count determines how many fast start advertisements LLDP sends from a port when it starts sending LLDP-MED advertisements from the port, for instance, when it detects a new LLDP-MED capable device.

The **no** variant of this command resets the LLDP-MED fast start count to the default (3).

**Syntax** `lldp faststart-count <1-10>`  
`no lldp faststart-count`

| Parameter | Description                                      |
|-----------|--|
| <1-10>    | The number of fast start advertisements to send. |

**Default** The default fast start count is 3.

**Mode** Global Configuration

**Examples** To set the fast start count to 5, use the command:

```
awplus# configure terminal
awplus(config)# lldp faststart-count 5
```

To reset the fast start count to the default setting (3), use the command:

```
awplus# configure terminal
awplus(config)# no lldp faststart-count
```

**Related commands** [show lldp](#)

# Ildp holdtime-multiplier

**Overview** This command sets the holdtime multiplier value. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors.

The **no** variant of this command sets the multiplier back to its default.

**Syntax** `lldp holdtime-multiplier <2-10>`  
`no lldp holdtime-multiplier`

| Parameter | Description            |
|-----------|------------------------|
| <2-10>    | The multiplier factor. |

**Default** The default holdtime multiplier value is 4.

**Mode** Global Configuration

**Usage** The Time-To-Live defines the period for which the information advertised to the neighbor is valid. If the Time-To-Live expires before the neighbor receives another update of the information, then the neighbor discards the information from its database.

**Examples** To set the holdtime multiplier to 2, use the commands:

```
awplus# configure terminal  
awplus(config)# lldp holdtime-multiplier 2
```

To set the holdtime multiplier back to its default, use the commands:

```
awplus# configure terminal  
awplus(config)# no lldp holdtime-multiplier 2
```

**Related commands** [show lldp](#)

# Ildp management-address

**Overview** This command sets the IPv4 address to be advertised to neighbors (in the Management Address TLV) via the specified ports. This address will override the default address for these ports.

The **no** variant of this command clears the user-configured management IP address advertised to neighbors via the specified ports. The advertised address reverts to the default.

**Syntax** `lldp management-address <ipaddr>`  
`no lldp management-address`

| Parameter                   | Description  |
|-----------------------------|--|
| <code>&lt;ipaddr&gt;</code> | The IPv4 address to be advertised to neighbors, in dotted decimal format. This must be one of the IP addresses already configured on the device. |

**Default** The local loopback interface primary IPv4 address if set, else the primary IPv4 interface address of the lowest numbered VLAN the port belongs to, else the MAC address of the device's baseboard if no VLAN IP addresses are configured for the port.

**Mode** Interface Configuration

**Usage notes** To see the management address that will be advertised, use the [show lldp interface](#) command or [show lldp local-info](#) command.

**Examples** To set the management address advertised by port1.0.1 and port1.0.2, to be 192.168.1.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp management-address 192.168.1.6
```

To clear the user-configured management address advertised by port1.0.1 and port1.0.2, and revert to using the default address, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp management-address
```

**Related commands** [show lldp interface](#)  
[show lldp local-info](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-notifications

**Overview** Use this command to enable LLDP to send LLDP-MED Topology Change Detected SNMP notifications relating to the specified ports. The switch sends an SNMP event notification when a new LLDP-MED compliant IP Telephony device is connected to or disconnected from a port on the switch.

Use the **no** variant of this command to disable the sending of LLDP-MED Topology Change Detected notifications relating to the specified ports.

**Syntax** `lldp med-notifications`  
`no lldp med-notifications`

**Default** The sending of LLDP-MED notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable the sending of LLDP-MED Topology Change Detected notifications relating to ports port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-notifications
```

To disable the sending of LLDP-MED notifications relating to port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-notifications
```

**Related commands** [lldp notification-interval](#)

[snmp-server enable trap](#)  
[show lldp interface](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp med-tlv-select

**Overview** Use this command to enable LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via the specified ports. The LLDP-MED Capabilities TLV must be enabled before any of the other LLDP-MED Organizationally Specific TLVs are enabled.

Use the **no** variant of this command to disable the specified LLDP-MED Organizationally Specific TLVs for transmission in LLDP advertisements via these ports. In order to disable the LLDP-MED Capabilities TLV, you must also disable the rest of these TLVs. Disabling all these TLVs disables LLDP-MED advertisements.

**Syntax**

```
lldp med-tlv-select [capabilities] [network-policy] [location]
[inventory-management]

lldp med-tlv-select all

no lldp med-tlv-select [capabilities] [network-policy]
[location] [inventory-management]

no lldp med-tlv-select all
```

| Parameter      | Description   |
|----------------|---|
| capabilities   | LLDP-MED Capabilities TLV. When this is enabled, the MAC/PHY Configuration/Status TLV from IEEE 802.3 Organizationally Specific TLVs is also automatically included in LLDP-MED advertisements, whether or not it has been explicitly enabled by the <code>lldp tlv-select</code> command.  |
| network-policy | Network Policy TLV. This TLV is transmitted if Voice VLAN parameters have been configured using the commands: <ul style="list-style-type: none"><li><code>switchport voice dscp</code></li><li><code>switchport voice vlan</code></li><li><code>switchport voice vlan priority</code></li></ul>   |
| location       | Location Identification TLV. This TLV is transmitted if location information has been configured using the commands: <ul style="list-style-type: none"><li><code>location elin-location-id</code></li><li><code>location civic-location identifier</code></li><li><code>location civic-location configuration</code></li><li><code>location coord-location identifier</code></li><li><code>location coord-location configuration</code></li><li><code>location elin-location</code></li></ul> |

| Parameter            | Description   |
|----------------------|---|
| inventory-management | Inventory Management TLV Set, including the following TLVs: <ul style="list-style-type: none"> <li>• Hardware Revision</li> <li>• Firmware Revision</li> <li>• Software Revision</li> <li>• Serial Number</li> <li>• Manufacturer Name</li> <li>• Model Name</li> <li>• Asset ID</li> </ul> |
| all                  | All LLDP-MED Organizationally Specific TLVs.  |

**Default** By default LLDP-MED Capabilities, Network Policy, Location Identification and Extended Power-via-MDI TLVs are enabled. Therefore, if LLDP is enabled using the `lldp run` command, by default LLDP-MED advertisements are transmitted on ports that detect LLDP-MED neighbors connected to them.

**Mode** Interface Configuration

**Usage notes** LLDP-MED TLVs are only sent in advertisements via a port if there is an LLDP-MED-capable device connected to it. To see whether there are LLDP-MED capable devices connected to the ports, use the `show lldp neighbors` command.

**Examples** To enable inclusion of the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp med-tlv-select inventory-management
```

To exclude the Inventory TLV Set in advertisements transmitted via port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select inventory-management
```

To disable LLDP-MED advertisements transmitted via port1.0.1 and port1.0.2, disable all these TLVs using the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp med-tlv-select all
```

**Related commands**

- switchport voice vlan priority

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp non-strict-med-tlv-order-check

**Overview** Use this command to enable non-strict order checking for LLDP-MED advertisements it receives. That is, use this command to enable LLDP to receive and store TLVs from LLDP-MED advertisements even if they do not use standard TLV order.

Use the **no** variant of this command to disable non-strict order checking for LLDP-MED advertisements, that is, to set strict TLV order checking, so that LLDP discards any LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement.

**Syntax** `lldp non-strict-med-tlv-order-check`  
`no lldp non-strict-med-tlv-order-check`

**Default** By default TLV non-strict order checking for LLDP-MED advertisements is disabled. That is, strict order checking is applied to LLDP-MED advertisements, according to ANSI/TIA-1057, and LLDP-MED TLVs in non-standard order are discarded.

**Mode** Global Configuration

**Usage notes** The ANSI/TIA-1057 specifies standard order for TLVs in LLDP-MED advertisements, and specifies that if LLDP receives LLDP advertisements with non-standard LLDP-MED TLV order, the TLVs in non-standard order should be discarded. This implementation of LLDP-MED follows the standard: it transmits TLVs in the standard order, and by default discards LLDP-MED TLVs that occur before the LLDP-MED Capabilities TLV in an advertisement. However, some implementations of LLDP transmit LLDP-MED advertisements with non-standard TLV order. To receive and store the data from these non-standard advertisements, enable non-strict order checking for LLDP-MED advertisements using this command.

**Examples** To enable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tlv-order-check
```

To disable strict TLV order checking, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tlv-order-check
```

**Related commands** [show running-config lldp](#)

# lldp notification-interval

**Overview** This command sets the notification interval. This is the minimum interval between LLDP SNMP notifications (traps) of each kind (LLDP Remote Tables Change Notification and LLDP-MED Topology Change Notification).

The **no** variant of this command sets the notification interval back to its default.

**Syntax** `lldp notification-interval <5-3600>`  
`no lldp notification-interval`

| Parameter | Description              |
|-----------|--------------------------|
| <5-3600>  | The interval in seconds. |

**Default** The default notification interval is 5 seconds.

**Mode** Global Configuration

**Examples** To set the notification interval to 20 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp notification-interval 20
```

To set the notification interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp notification-interval
```

**Related commands** [lldp notifications](#)  
[show lldp](#)

# Ildp notifications

**Overview** This command enables the sending of LLDP SNMP notifications (traps) relating to specified ports.

The **no** variant of this command disables the sending of LLDP SNMP notifications for specified ports.

**Syntax** `lldp notifications`  
`no lldp notifications`

**Default** The sending of LLDP SNMP notifications is disabled by default.

**Mode** Interface Configuration

**Examples** To enable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp notifications
```

To disable sending of LLDP SNMP notifications for ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp notifications
```

**Related commands** [lldp notification-interval](#)  
[show lldp interface](#)  
[snmp-server enable trap](#)

# lldp port-number-type

**Overview** This command sets the type of port identifier used to enumerate, that is to count, the LLDP MIB local port entries. The LLDP MIB (IEEE Standard 802.1AB-2005, Section 12, LLDP MIB Definitions.) requires the port number value to count LLDP local port entries.

This command also enables you to optionally set an interface index to enumerate the LLDP MIB local port entries, if required by your management system.

The **no** variant of this command resets the type of port identifier back to the default setting (number).

**Syntax** `lldp port-number-type [number|ifindex]`  
`no lldp port-number-type`

| Parameter | Description   |
|-----------|---|
| number    | Set the type of port identifier to a port number to enumerate the LLDP MIB local port entries.      |
| ifindex   | Set the type of port identifier to an interface index to enumerate the LLDP MIB local port entries. |

**Default** The default port identifier type is number. The no variant of this command sets the port identifier type to the default.

**Mode** Global Configuration

**Examples** To set the type of port identifier used to enumerate LLDP MIB local port entries to port numbers, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type number
```

To set the type of port identifier used to enumerate LLDP MIB local port entries to interface indexes, use the commands:

```
awplus# configure terminal
awplus(config)# lldp port-number-type ifindex
```

To reset the type of port identifier used to enumerate LLDP MIB local port entries the default (port numbers), use the commands:

```
awplus# configure terminal
awplus(config)# no lldp port-number-type
```

**Related commands** [show lldp](#)

# Ildp reinit

**Overview** This command sets the value of the reinitialization delay. This is the minimum time after disabling LLDP on a port before it can reinitialize.

The **no** variant of this command sets the reinitialization delay back to its default setting.

**Syntax** `lldp reinit <1-10>`  
`no lldp reinit`

| Parameter | Description           |
|-----------|-----------------------|
| <1-10>    | The delay in seconds. |

**Default** The default reinitialization delay is 2 seconds.

**Mode** Global Configuration

**Examples** To set the reinitialization delay to 3 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp reinit 3
```

To set the reinitialization delay back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp reinit
```

**Related commands** [show lldp](#)

# lldp run

**Overview** This command enables the operation of LLDP on the device.  
The **no** variant of this command disables the operation of LLDP on the device. The LLDP configuration remains unchanged.

**Syntax** lldp run  
no lldp run

**Default** LLDP is disabled by default.

**Mode** Global Configuration

**Examples** To enable LLDP operation, use the commands:

```
awplus# configure terminal  
awplus(config)# lldp run
```

To disable LLDP operation, use the commands:

```
awplus# configure terminal  
awplus(config)# no lldp run
```

**Related commands** [show lldp](#)

# lldp timer

**Overview** This command sets the value of the transmit interval. This is the interval between regular transmissions of LLDP advertisements.

The **no** variant of this command sets the transmit interval back to its default.

**Syntax** `lldp timer <5-32768>`  
`no lldp timer`

| Parameter                    | Description  |
|------------------------------|--|
| <code>&lt;5-32768&gt;</code> | The transmit interval in seconds. The transmit interval must be at least four times the transmission delay timer ( <a href="#">lldp tx-delay</a> command). |

**Default** The default transmit interval is 30 seconds.

**Mode** Global Configuration

**Examples** To set the transmit interval to 90 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp timer 90
```

To set the transmit interval back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp timer
```

**Related commands** [lldp tx-delay](#)  
[show lldp](#)

# lldp tlv-select

**Overview** This command enables one or more optional TLVs, or all TLVs, for transmission in LLDP advertisements via the specified ports. The TLVs can be specified in any order; they are placed in LLDP frames in a fixed order (as described in IEEE 802.1AB). The mandatory TLVs (Chassis ID, Port ID, Time To Live, End of LLDPDU) are always included in LLDP advertisements.

In LLDP-MED advertisements the MAC/PHY Configuration/Status TLV will be always be included regardless of whether it is selected by this command.

The **no** variant of this command disables the specified optional TLVs, or all optional TLVs, for transmission in LLDP advertisements via the specified ports.

**Syntax**

```
lldp tlv-select { [<tlv>]... }  
lldp tlv-select all  
no lldp tlv-select { [<tlv>]... }  
no lldp tlv-select all
```

| Parameter | Description  |
|-----------|--|
| <tlv>     | The TLV to transmit in LLDP advertisements. One of these keywords: <ul style="list-style-type: none"><li>• port-description (specified by the <a href="#">description (interface)</a> command)</li><li>• system-name (specified by the <a href="#">hostname</a> command)</li><li>• system-description</li><li>• system-capabilities</li><li>• management-address</li><li>• port-vlan</li><li>• port-and-protocol-vlans</li><li>• vlan-names</li><li>• protocol-ids</li><li>• mac-phy-config</li><li>• power-management (Power Via MDI TLV)</li><li>• link-aggregation</li><li>• max-frame-size</li></ul> |
| all       | All TLVs.  |

**Default** By default no optional TLVs are included in LLDP advertisements. The MAC/PHY Configuration/Status TLV ( **mac-phy-config**) is included in LLDP-MED advertisements whether or not it is selected by this command.

**Mode** Interface Configuration

**Examples** To include the management-address and system-name TLVs in advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp tlv-select management-address
system-name
```

To include all optional TLVs in advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# lldp tlv-select all
```

To exclude the management-address and system-name TLVs from advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp tlv-select management-address
system-name
```

To exclude all optional TLVs from advertisements transmitted via ports 1.0.1 and 1.0.6, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.6
awplus(config-if)# no lldp tlv-select all
```

# Ildp transmit receive

**Overview** This command enables transmission and/or reception of LLDP advertisements to or from neighbors through the specified ports.

The **no** variant of this command disables transmission and/or reception of LLDP advertisements through specified ports.

**Syntax** `lldp {[transmit] [receive]}`  
`no lldp {[transmit] [receive]}`

| Parameter | Description   |
|-----------|---|
| transmit  | Enable or disable transmission of LLDP advertisements via this port or ports. |
| receive   | Enable or disable reception of LLDP advertisements via this port or ports.    |

**Default** LLDP advertisement transmission and reception are enabled on all ports by default.

**Mode** Interface Configuration

**Examples** To enable transmission of LLDP advertisements on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit
```

To enable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# lldp transmit receive
```

To disable LLDP advertisement transmission and reception on port1.0.1 and port1.0.2, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.2
awplus(config-if)# no lldp transmit receive
```

**Related commands** [show lldp interface](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# lldp tx-delay

**Overview** This command sets the value of the transmission delay timer. This is the minimum time interval between transmitting LLDP advertisements due to a change in LLDP local information.

The **no** variant of this command sets the transmission delay timer back to its default setting.

**Syntax** `lldp tx-delay <1-8192>`  
`no lldp tx-delay`

| Parameter                   | Description  |
|-----------------------------|--|
| <code>&lt;1-8192&gt;</code> | The transmission delay in seconds. The transmission delay cannot be greater than a quarter of the transmit interval ( <a href="#">lldp timer</a> command). |

**Default** The default transmission delay timer is 2 seconds.

**Mode** Global Configuration

**Examples** To set the transmission delay timer to 12 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# lldp tx-delay 12
```

To set the transmission delay timer back to its default, use the commands:

```
awplus# configure terminal
awplus(config)# no lldp tx-delay
```

**Related commands** [lldp timer](#)  
[show lldp](#)

# location civic-location configuration

**Overview** Use these commands to configure a civic address location. The country parameter must be specified first, and at least one of the other parameters must be configured before the location can be assigned to a port.

Use the **no** variants of this command to delete civic address parameters from the location.

**Syntax**

```
country <country>
state <state>
no state
county <county>
no county
city <city>
no city
division <division>
no division
neighborhood <neighborhood>
no neighborhood
street-group <street-group>
no street-group
leading-street-direction <leading-street-direction>
no leading-street-direction
trailing-street-suffix <trailing-street-suffix>
no trailing-street-suffix
street-suffix <street-suffix>
no street-suffix
house-number <house-number>
no house-number
house-number-suffix <house-number-suffix>
no house-number-suffix
landmark <landmark>
no landmark
additional-information <additional-information>
no additional-information
```

**Syntax (cont.)** name <name>  
no name  
postalcode <postalcode>  
no postalcode  
building <building>  
no building  
unit <unit>  
no unit

no streetname-post-modifier

| Parameter                                     | Description  |
|---|--|
| <code>&lt;country&gt;</code>                  | Upper-case two-letter country code, as specified in ISO 3166.                      |
| <code>&lt;state&gt;</code>                    | State (Civic Address (CA) Type 1): national subdivisions (state, canton, region).  |
| <code>&lt;county&gt;</code>                   | County (CA Type 2): County, parish, gun (JP), district (IN).                       |
| <code>&lt;city&gt;</code>                     | City (CA Type 3): city, township, shi (JP).  |
| <code>&lt;division&gt;</code>                 | City division (CA Type 4): City division, borough, city district, ward, chou (JP). |
| <code>&lt;neighborhood&gt;</code>             | Neighborhood (CA Type 5): neighborhood, block.                                     |
| <code>&lt;street-group&gt;</code>             | Street group (CA Type 6): group of streets below the neighborhood level.           |
| <code>&lt;leading-street-direction&gt;</code> | Leading street direction (CA Type 16).   |
| <code>&lt;trailing-street-suffix&gt;</code>   | Trailing street suffix (CA Type 17).   |
| <code>&lt;street-suffix&gt;</code>            | Street suffix (CA Type 18): street suffix or type.                                 |
| <code>&lt;house-number&gt;</code>             | House number (CA Type 19).   |
| <code>&lt;house-number-suffix&gt;</code>      | House number suffix (CA Type 20).  |
| <code>&lt;landmark&gt;</code>                 | Landmark or vanity address (CA Type 21).   |
| <code>&lt;additional-information&gt;</code>   | Additional location information (CA Type 22).                                      |
| <code>&lt;name&gt;</code>                     | Name (CA Type 23): residence and office occupant.                                  |
| <code>&lt;postal-code&gt;</code>              | Postal/zip code (CA Type 24).  |
| <code>&lt;building&gt;</code>                 | Building (CA Type 25): structure.  |
| <code>&lt;unit&gt;</code>                     | Unit (CA Type 26): apartment, suite.   |
| <code>&lt;floor&gt;</code>                    | Floor (CA Type 27).  |
| <code>&lt;room&gt;</code>                     | Room (CA Type 28).   |
| <code>&lt;place-type&gt;</code>               | Type of place (CA Type 29).  |
| <code>&lt;postal-community-name&gt;</code>    | Postal community name (CA Type 30).  |
| <code>&lt;post-office-box&gt;</code>          | Post office box (P.O. Box) (CA Type 31).   |
| <code>&lt;additional-code&gt;</code>          | Additional code (CA Type 32).  |
| <code>&lt;seat&gt;</code>                     | Seat (CA Type 33): seat (desk, cubicle, workstation).                              |
| <code>&lt;primary-road-name&gt;</code>        | Primary road name (CA Type 34).  |
| <code>&lt;road-section&gt;</code>             | Road section (CA Type 35).   |

| Parameter                                      | Description                             |
|--|---|
| <code>&lt;branch-road-name&gt;</code>          | Branch road name (CA Type 36).          |
| <code>&lt;sub-branch-road-name&gt;</code>      | Sub-branch road name (CA Type 37).      |
| <code>&lt;street-name-pre-modifier&gt;</code>  | Street name pre-modifier (CA Type 38).  |
| <code>&lt;street-name-post-modifier&gt;</code> | Street name post-modifier (CA Type 39). |

**Default** By default no civic address location information is configured.

**Mode** Civic Address Location Configuration

**Usage notes** The **country** parameter must be configured before any other parameters can be configured; this creates the location. The country parameter cannot be deleted. One or more of the other parameters must be configured before the location can be assigned to a port. The country parameter must be entered as an upper-case two-letter country code, as specified in ISO 3166. All other parameters are entered as alpha-numeric strings. Do not configure all the civic address parameters (this would generate TLVs that are too long). Configure a subset of these parameters—enough to consistently and precisely identify the location of the device. If the location is to be used for Emergency Call Service (ECS), the particular ECS application may have guidelines for configuring the civic address location. For more information about civic address format, see the [LLDP Feature Overview and Configuration Guide](#).

To specify the civic address location, use the [location civic-location identifier](#) command. To delete the civic address location, use the **no** variant of the **location civic-location identifier** command. To assign the civic address location to particular ports, so that it can be advertised in TLVs from those ports, use the command [location civic-location-id](#) command.

**Examples** To configure civic address location 1 with location "27 Nazareth Avenue, Christchurch, New Zealand" in civic-address format, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)# country NZ
awplus(config-civic)# city Christchurch
awplus(config-civic)# primary-road-name Nazareth
awplus(config-civic)# street-suffix Avenue
awplus(config-civic)# house-number 27
```

**Related commands**

# location civic-location identifier

**Overview** Use this command to enter the Civic Address Location Configuration mode to configure the specified location.

Use the **no** variant of this command to delete a civic address location. This also removes the location from any ports it has been assigned to.

**Syntax** `location civic-location identifier <civic-loc-id>`  
`no location civic-location identifier <civic-loc-id>`

| Parameter                         | Description   |
|-----------------------------------|---|
| <code>&lt;civic-loc-id&gt;</code> | A unique civic address location ID, in the range 1 to 4095. |

**Default** By default there are no civic address locations.

**Mode** Global Configuration

**Usage notes** To configure the location information for this civic address location identifier, use the [location civic-location configuration](#) command. To associate this civic location identifier with particular ports, use the [location elin-location-id](#) command.

Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

**Examples** To enter Civic Address Location Configuration mode for the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location civic-location identifier 1
awplus(config-civic)#
```

To delete the civic address location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location civic-location identifier 1
```

**Related commands**

- [location civic-location-id](#)
- [location civic-location configuration](#)
- [show location](#)
- [show running-config lldp](#)

# location civic-location-id

**Overview** Use this command to assign a civic address location to the ports. The civic address location must already exist. This replaces any previous assignment of civic address location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** `location civic-location-id <civic-loc-id>`  
`no location civic-location-id [<civic-loc-id>]`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;civic-loc-id&gt;</code> | Civic address location ID, in the range 1 to 4095. |

**Default** By default no civic address location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The civic address location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, create the location using the following commands:

- [location civic-location identifier](#) command
- [location civic-location configuration](#) command

If a civic-address location is deleted using the **no** variant of the [location civic-location identifier](#) command, it is automatically removed from all ports.

**Examples** To assign the civic address location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location civic-location-id 1
```

To remove a civic address location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location civic-location-id
```

**Related commands** [lldp med-tlv-select](#)  
[location civic-location identifier](#)  
[location civic-location configuration](#)  
[show location](#)

**Command changes** Version 5.4.8-2.1: Command added to AR2050V, AR3050S, AR4050S

# location coord-location configuration

**Overview** Use this command to configure a coordinate-based location. All parameters must be configured before assigning this location identifier to a port.

**Syntax**

```
latitude <latitude>  
lat-resolution <lat-resolution>  
longitude <longitude>  
long-resolution <long-resolution>  
altitude <altitude> {meters|floor}  
alt-resolution <alt-resolution>  
datum {wgs84|nad83-navd|nad83-mllw}
```

| Parameter         | Description   |
|-------------------|---|
| <lat-resolution>  | Latitude resolution, as a number of valid bits, in the range 0 to 34.   |
| <latitude>        | Latitude value in degrees in the range -90.0 to 90.0  |
| <long-resolution> | Longitude resolution, as a number of valid bits, in the range 0 to 34.  |
| <longitude>       | Longitude value in degrees, in the range -180.0 to 180.0.   |
| <alt-resolution>  | Altitude resolution, as a number of valid bits, in the range 0 to 30. A resolution of 0 can be used to indicate an unknown value. |
| <altitude>        | Altitude value, in meters or floors.  |
| meters            | The altitude value is in meters.  |
| floors            | The altitude value is in floors.  |
| datum             | The geodetic system (or datum) that the specified coordinate values are based on.   |
| wgs84             | World Geodetic System 1984.   |
| nad83-navd        | North American Datum 1983 - North American Vertical Datum.  |
| nad83-mllw        | North American Datum 1983 - Mean Lower Low Water vertical datum.  |

**Default** By default no coordinate location information is configured.

**Mode** Coordinate Configuration

**Usage** Latitude and longitude values are always stored internally, and advertised in the Location Identification TLV, as 34-bit fixed-point binary numbers, with a 25-bit fractional part, irrespective of the number of digits entered by the user. Likewise

altitude is stored as a 30-bit fixed point binary number, with an 8-bit fractional part. Because the user-entered decimal values are stored as fixed point binary numbers, they cannot always be represented exactly—the stored binary number is converted to a decimal number for display in the output of the [show location](#) command. For example, a user-entered latitude value of “2.77” degrees is displayed as “2.7699999809265136718750000”.

The **lat-resolution**, **long-resolution**, and **alt-resolution** parameters allow the user to specify the resolution of each coordinate element as the number of valid bits in the internally-stored binary representation of the value. These resolution values can be used by emergency services to define a search area.

To specify the coordinate identifier, use the [location coord-location identifier](#) command. To remove coordinate information, delete the coordinate location by using the **no** variant of that command. To associate the coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location elin-location-id](#) command.

**Example** To configure the location for the White House in Washington DC, which has the coordinates based on the WGS84 datum of 38.89868 degrees North (with 22 bit resolution), 77.03723 degrees West (with 22 bit resolution), and 15 meters height (with 9 bit resolution), use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)# la-resolution 22
awplus(config-coord)# latitude 38.89868
awplus(config-coord)# lo-resolution 22
awplus(config-coord)# longitude -77.03723
awplus(config-coord)# alt-resolution 9
awplus(config-coord)# altitude 15 meters
awplus(config-coord)# datum wgs84
```

# location coord-location identifier

**Overview** Use this command to enter Coordinate Location Configuration mode for this coordinate location.

Use the **no** variant of this command to delete a coordinate location. This also removes the location from any ports it has been assigned to.

**Syntax** `location coord-location identifier <coord-loc-id>`  
`no location coord-location identifier <coord-loc-id>`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;coord-loc-id&gt;</code> | A unique coordinate location identifier, in the range 1 to 4095. |

**Default** By default there are no coordinate locations.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To configure this coordinate location, use the [location coord-location configuration](#) command. To associate this coordinate location with particular ports, so that it can be advertised in TLVs from those ports, use the [location coord-location-id](#) command.

**Examples** To enter Coordinate Location Configuration mode to configure the coordinate location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# location coord-location identifier 1
awplus(config-coord)#
```

To delete coordinate location 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location coord-location identifier 1
```

**Related commands** [location coord-location-id](#)  
[location coord-location configuration](#)  
[show lldp local-info](#)  
[show location](#)

# location coord-location-id

**Overview** Use this command to assign a coordinate location to the ports. The coordinate location must already exist. This replaces any previous assignment of coordinate location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location from the ports.

**Syntax** `location coord-location-id <coord-loc-id>`  
`no location coord-location-id [<coord-loc-id>]`

| Parameter                         | Description                                     |
|-----------------------------------|---|
| <code>&lt;coord-loc-id&gt;</code> | Coordinate location ID, in the range 1 to 4095. |

**Default** By default no coordinate location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** The coordinate location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the following commands:

- [location coord-location identifier](#) command
- [location coord-location configuration](#) command

If a coordinate location is deleted using the **no** variant of the [location coord-location identifier](#) command, it is automatically removed from all ports.

**Examples** To assign coordinate location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location coord-location-id 1
```

To remove a coordinate location from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location coord-location-id
```

# location elin-location

**Overview** Use this command to create or modify an ELIN location.

Use the **no** variant of this command to delete an ELIN location, and remove it from any ports it has been assigned to.

**Syntax** `location elin-location <elin> identifier <elin-loc-id>`  
`no location elin-location identifier <elin-loc-id>`

| Parameter                        | Description  |
|----------------------------------|--|
| <code>&lt;elin&gt;</code>        | Emergency Location Identification Number (ELIN) for Emergency Call Service (ECS), in the range 10 to 25 digits long. In North America, ELINs are typically 10 digits long. |
| <code>&lt;elin-loc-id&gt;</code> | A unique ELIN location identifier, in the range 1 to 4095.   |

**Default** By default there are no ELIN location identifiers.

**Mode** Global Configuration

**Usage** Up to 400 locations can be configured on the switch for each type of location information, up to a total of 1200 locations.

To assign this ELIN location to particular ports, so that it can be advertised in TLVs from those ports, use the [location elin-location-id](#) command.

**Examples** To create a new ELIN location with ID 1, and configure it with ELIN "1234567890", use the commands:

```
awplus# configure terminal
awplus(config)# location elin-location 1234567890 identifier 1
```

To delete existing ELIN location with ID 1, use the commands:

```
awplus# configure terminal
awplus(config)# no location elin-location identifier 1
```

**Related commands** [location elin-location-id](#)  
[show lldp local-info](#)  
[show location](#)

# location elin-location-id

**Overview** Use this command to assign an ELIN location to the ports. The ELIN location must already exist. This replaces any previous assignment of ELIN location for the ports. Up to one location of each type can be assigned to a port.

Use the **no** variant of this command to remove a location identifier from the ports.

**Syntax** `location elin-location-id <elin-loc-id>`  
`no location elin-location-id [<elin-loc-id>]`

| Parameter                        | Description                                       |
|----------------------------------|---|
| <code>&lt;elin-loc-id&gt;</code> | ELIN location identifier, in the range 1 to 4095. |

**Default** By default no ELIN location is assigned to ports.

**Mode** Interface Configuration

**Usage notes** An ELIN location associated with a port can be transmitted in Location Identification TLVs via the port.

Before using this command, configure the location using the [location elin-location](#) command.

If an ELIN location is deleted using the **no** variant of one of the [location elin-location](#) command, it is automatically removed from all ports.

**Examples** To assign ELIN location 1 to port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# location elin-location-id 1
```

To remove ELIN location 1 from port1.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1
awplus(config-if)# no location elin-location-id 1
```

# show debugging lldp

**Overview** This command displays LLDP debug settings for specified ports. If no port list is supplied, LLDP debug settings for all ports are displayed.

**Syntax** `show debugging lldp [interface <port-list>]`

| Parameter   | Description  |
|-------------|--|
| <port-list> | The ports for which the LLDP debug settings are shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP debug settings for all ports, use the command:

```
awplus# show debugging lldp
```

To display LLDP debug settings for ports 1.0.1 to 1.0.6, use the command:

```
awplus# show debugging lldp interface port1.0.1-1.0.6
```

**Output** Figure 67-1: Example output from the **show debugging lldp** command

```
LLDP Debug settings:
Debugging for LLDP internal operation is on
Port      Rx      RxPkt   Tx      TxPkt
-----
1.0.1     Yes    Yes     No      No
1.0.2     Yes    No      No      No
1.0.3     No     No      No      No
1.0.4     Yes    Yes     Yes     No
1.0.5     Yes    No      Yes     No
1.0.6     Yes    Yes     Yes     Yes
```

**Table 1:** Parameters in the output of the **show debugging lldp** command

| Parameter | Description  |
|-----------|--|
| Port      | Port name.   |
| Rx        | Whether debugging of LLDP receive is enabled on the port.              |
| RxPkt     | Whether debugging of LLDP receive packet dump is enabled on the port.  |
| Rx        | Whether debugging of LLDP transmit is enabled on the port.             |
| RxPkt     | Whether debugging of LLDP transmit packet dump is enabled on the port. |

**Related  
commands** [debug lldp](#)

# show lldp

**Overview** This command displays LLDP status and global configuration settings.

**Syntax** show lldp

**Mode** User Exec and Privileged Exec

**Example** To display LLDP status and global configuration settings, use the command:

```
awplus# show lldp
```

## Output

**Table 2:** Example output from the **show lldp** command

```
awplus# show lldp

LLDP Global Configuration:                               [Default Values]
LLDP Status ..... Enabled                               [Disabled]
Notification Interval ..... 5 secs                     [5]
Tx Timer Interval ..... 30 secs                         [30]
Hold-time Multiplier ..... 4                           [4]
(Computed TTL value ..... 120 secs)
Reinitialization Delay .... 2 secs                      [2]
Tx Delay ..... 2 secs                                   [2]

Port Number Type..... Ifindex                           [Port-Number]
Fast Start Count ..... 5                                [3]

LLDP Global Status:
Total Neighbor Count ..... 47
Neighbors table last updated 0 hrs 0 mins 43 secs ago
```

**Table 3:** Parameters in the output of the **show lldp** command

| Parameter              | Description   |
|------------------------|---|
| LLDP Status            | Whether LLDP is enabled. Default is disabled.   |
| Notification Interval  | Minimum interval between LLDP notifications.  |
| Tx Timer Interval      | Transmit interval between regular transmissions of LLDP advertisements.   |
| Hold-time Multiplier   | The holdtime multiplier. The transmit interval is multiplied by the holdtime multiplier to give the Time To Live (TTL) value that is advertised to neighbors. |
| Reinitialization Delay | The reinitialization delay. This is the minimum time after disabling LLDP transmit on a port before it can reinitialize again.                                |

**Table 3:** Parameters in the output of the **show lldp** command (cont.)

| Parameter                    | Description  |
|------------------------------|--|
| Tx Delay                     | The transmission delay. This is the minimum time interval between transmitting advertisements due to a change in LLDP local information. |
| Port Number Type             | The type of port identifier used to enumerate LLDP MIB local port entries, as set by the lldp port-number-type command.                  |
| Fast Start Count             | The number of times fast start advertisements are sent for LLDP-MED.   |
| Total Neighbor Count         | Number of LLDP neighbors discovered on all ports.  |
| Neighbors table last updated | The time since the LLDP neighbor table was last updated.   |

**Related commands** [show lldp interface](#)  
[show running-config lldp](#)

# show lldp interface

**Overview** This command displays LLDP configuration settings for specified ports. If no port list is specified, LLDP configuration for all ports is displayed.

**Syntax** `show lldp interface [<port-list>]`

| Parameter   | Description  |
|-------------|--|
| <port-list> | The ports for which the LLDP configuration settings are to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display LLDP configuration settings for ports 1.0.1 to 1.0.6, use the command:

```
awplus# show lldp interface port1.0.1-1.0.6
```

To display LLDP configuration settings for all ports, use the command:

```
awplus# show lldp interface
```

**Output** Figure 67-2: Example output from the **show lldp interface** command

```
awplus# show lldp interface port1.0.1-1.0.8

| MED TLVs Enabled for Tx   | List of optional LLDP-MED TLVs enabled for transmission: <ul style="list-style-type: none"> <li>• Mc = LLDP-MED Capabilities</li> <li>• Np = Network Policy</li> <li>• Lo = Location Information,</li> <li>• Pe = Extended Power-Via-MDI</li> <li>• In = Inventory</li> </ul> |

**Related commands** [show lldp](#)  
[show running-config lldp](#)

# show lldp local-info

**Overview** This command displays local LLDP information that can be transmitted through specified ports. If no port list is entered, local LLDP information for all ports is displayed.

**Syntax** `show lldp local-info [base] [dot1] [dot3] [med] [interface <port-list>]`

| Parameter   | Description   |
|-------------|---|
| base        | Information for base TLVs.                                |
| dot1        | Information for 802.1 TLVs.                               |
| dot3        | Information for 802.3 TLVs.                               |
| med         | Information for LLDP-MED TLVs.                            |
| <port-list> | The ports for which the local information is to be shown. |

**Mode** User Exec and Privileged Exec

**Usage notes** Whether and which local information is transmitted in advertisements via a port depends on:

- whether the port is set to transmit LLDP advertisements ([lldp transmit receive](#) command)
- which TLVs it is configured to send ([lldp tlv-select](#) command, [lldp med-tnv-select](#) command)

**Examples** To display local information transmitted via port 1.0.1, use the command:

```
awplus# show lldp local-info interface port1.0.1
```

To display local information transmitted via all ports, use the command:

```
awplus# show lldp local-info
```

**Output** Figure 67-3: Example output from **show lldp local-info**

```
LLDP Local Information:

  Chassis ID Type ..... MAC address
  Chassis ID ..... 0015.77c9.7453
  Port ID Type ..... Interface alias
  Port ID ..... port1.0.1
  TTL ..... 120
  Port Description ..... [not configured]
```

```
System Name ..... awplus
System Description ..... Allied Telesis router/switch, AW+
                          v5.4.6
System Capabilities - Supported .. Bridge, Router
                    - Enabled .... Bridge, Router
Management Address ..... 192.168.1.6
Port VLAN ID (PVID) ..... 1
Port & Protocol VLAN - Supported . Yes
                    - Enabled ... No
                    - VIDs ..... 0
VLAN Names ..... default
Protocol IDs ..... 9000, 0026424203000000, 888e01, aaaa03,
                    88090101, 00540000e302, 0800, 0806, 86dd
MAC/PHY Auto-negotiation ..... Supported, Enabled
  Advertised Capability ..... 1000BaseTFD, 100BaseTXFD, 100BaseTX,
                              10BaseTFD, 10BaseT
  Operational MAU Type ..... 1000BaseTFD (30)
Power Via MDI (PoE) ..... Supported, Enabled
  Port Class ..... PSE
  Pair Control Ability ..... Disabled
  Power Class ..... Unknown
Link Aggregation ..... Supported, Disabled
Maximum Frame Size ..... 1522
LLDP-MED Device Type ..... Network Connectivity
LLDP-MED Capabilities ..... LLDP-MED Capabilities, Network Policy,
                              Location Identification,
                              Extended Power - PSE, Inventory
Network Policy ..... [not configured]
Location Identification ..... Civic Address
  Country Code ..... NZ
  City ..... Christchurch
  Street Suffix ..... Avenue
  House Number ..... 27
  Primary Road Name ..... Nazareth
Location Identification ..... ELIN
  ELIN ..... 123456789012
LLDP-MED Device Type ..... Network Connectivity
LLDP-MED Capabilities ..... LLDP-MED Capabilities, Network Policy,
                              Location Identification,
                              Extended Power - PSE, Inventory
Extended Power Via MDI (PoE) ..... PSE
  Power Source ..... Primary Power
  Power Priority ..... Low
  Power Value ..... 4.4 Watts
Inventory Management:
  Hardware Revision ..... A-0
  Firmware Revision ..... 1.1.0
  Software Revision ..... v5.4.6
  Serial Number ..... G1Q78900B
  Manufacturer Name ..... Allied Telesis Inc.
  Model Name ..... AT-x930-52GPX
  Asset ID ..... [zero length]
```

Table 67-1: Parameters in the output of **show lldp local-info**

| Parameter                        | Description   |
|----------------------------------|---|
| Chassis ID Type                  | Type of the Chassis ID.   |
| Chassis ID                       | Chassis ID that uniquely identifies the local device.   |
| Port ID Type                     | Type of the Port ID.  |
| Port ID                          | Port ID of the local port through which advertisements are sent.  |
| TTL                              | Number of seconds that the information advertised by the local port remains valid.  |
| Port Description                 | Port description of the local port, as specified by the <a href="#">description (interface)</a> command.                    |
| System Name                      | System name, as specified by the <a href="#">hostname</a> command.  |
| System Description               | System description.   |
| System Capabilities (Supported)  | Capabilities that the local port supports.  |
| System Capabilities (Enabled)    | Enabled capabilities on the local port.   |
| Management Addresses             | Management address associated with the local port. To change this, use the <a href="#">lldp management-address</a> command. |
| Port VLAN ID (PVID)              | VLAN identifier associated with untagged or priority tagged frames received via the local port.                             |
| Port & Protocol VLAN (Supported) | Whether Port & Protocol VLANs (PPV) is supported on the local port.   |
| Port & Protocol VLAN (Enabled)   | Whether the port is in one or more Port & Protocol VLANs.   |
| Port & Protocol VLAN (VIDs)      | List of identifiers for Port & Protocol VLANs that the port is in.  |
| VLAN Names                       | List of VLAN names for VLANs that the local port is assigned to.  |
| Protocol IDs                     | List of protocols that are accessible through the local port.   |
| MAC/PHY Auto-negotiation         | Auto-negotiation support and current status of the 802.3 LAN on the local port.   |

Table 67-1: Parameters in the output of **show lldp local-info** (cont.)

| Parameter                    | Description  |
|------------------------------|--|
| Power Via MDI (PoE)          | PoE-capability and current status on the local port.   |
| Port Class                   | Whether the device is a PSE (Power Sourcing Entity) or a PD (Powered Device)                                   |
| Pair Control Ability         | Whether power pair selection can be controlled   |
| Power Pairs                  | Which power pairs are selected for power ("Signal Pairs" or "Spare Pairs") if pair selection can be controlled |
| Power Class                  | The power class of the PD device on the port (class 0, 1, 2, 3 or 4)   |
| Link Aggregation             | Whether the link is capable of being aggregated and it is currently in an aggregation.                         |
| Aggregated Port-ID           | Aggregated port identifier.  |
| Maximum Frame Size           | The maximum frame size capability of the implemented MAC and PHY.  |
| LLDP-MED Device Type         | LLDP-MED device type   |
| LLDP-MED Capabilities        | Capabilities LLDP-MED capabilities supported on the local port.  |
| Network Policy               | List of network policies configured on the local port.   |
| VLAN ID                      | VLAN identifier for the port for the specified application type  |
| Tagged Flag                  | Whether the VLAN ID is to be used as tagged or untagged  |
| Layer-2 Priority:            | Layer 2 User Priority (in the range 0 to 7)  |
| DSCP Value                   | Diffserv codepoint (in the range 0 to 63)  |
| Location Identification      | Location configured on the local port.   |
| Extended Power Via MDI (PoE) | PoE-capability and current status of the PoE parameters for Extended Power-Via-MDI TLV on the local port.      |
| Power Source                 | The power source the switch currently uses; either primary power or backup power.                              |
| Power Priority               | The power priority configured on the port; either critical, high or low.                                       |

Table 67-1: Parameters in the output of **show lldp local-info** (cont.)

| Parameter            | Description  |
|----------------------|--|
| Power Value          | The total power the switch can source over a maximum length cable to a PD device on the port. The value shows the power value in Watts from the PD side. |
| Inventory Management | Inventory information for the device.  |

# show lldp neighbors

**Overview** This command displays a summary of information received from neighbors via specified ports. If no port list is supplied, neighbor information for all ports is displayed.

**Syntax** `show lldp neighbors [interface <port-list>]`

| Parameter   | Description  |
|-------------|--|
| <port-list> | The ports for which the neighbor information is to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors
```

To display neighbor information received via ports 1.0.1 and 1.0.6 with LLDP-MED configuration, use the command:

```
awplus# show lldp neighbors interface port1.0.1,port1.0.6
```

**Output** Figure 67-4: Example output from the **show lldp neighbors** command

```

**Table 68:** Parameters in the output of the **show lldp neighbors** command

| Parameter           | Description  |
|---------------------|--|
| Local Port          | Local port on which the neighbor information was received.       |
| Neighbor Chassis ID | Chassis ID that uniquely identifies the neighbor.                |
| Neighbor Port Name  | Port ID of the neighbor.   |
| Neighbor Sys Name   | System name of the LLDP neighbor.                                |
| Neighbor Capability | Capabilities that are supported and enabled on the neighbor.     |
| System Capability   | System Capabilities of the LLDP neighbor.                        |
| MED Device Type     | LLDP-MED Device class (Class I, II, III or Network Connectivity) |
| MED Power Source    | LLDP-MED Power Source  |

**Related commands** [show lldp neighbors detail](#)

# show lldp neighbors detail

**Overview** This command displays in detail the information received from neighbors via specified ports. If no port list is supplied, detailed neighbor information for all ports is displayed.

**Syntax** `show lldp neighbors detail [base] [dot1] [dot3] [med] [interface <port-list>]`

| Parameter   | Description  |
|-------------|--|
| base        | Information for base TLVs.                                   |
| dot1        | Information for 802.1 TLVs.                                  |
| dot3        | Information for 803.1 TLVs.                                  |
| med         | Information for LLDP-MED TLVs.                               |
| <port-list> | The ports for which the neighbor information is to be shown. |

**Mode** User Exec and Privileged Exec

**Examples** To display detailed neighbor information received via all ports, use the command:

```
awplus# show lldp neighbors detail
```

To display detailed neighbor information received via ports 1.0.1, use the command:

```
awplus# show lldp neighbors detail interface port1.0.1
```

**Output** Figure 67-5: Example output from the **show lldp neighbors detail** command

```
awplus#show lldp neighbors detail interface port1.0.1

# show lldp statistics

**Overview** This command displays the global LLDP statistics (packet and event counters).

**Syntax** show lldp statistics

**Mode** User Exec and Privileged Exec

**Example** To display global LLDP statistics information, use the command:

```
awplus# show lldp statistics
```

## Output

**Table 70:** Example output from the **show lldp statistics** command

```
awplus# show lldp statistics

Global LLDP Packet and Event counters:

Frames:   Out ..... 345
          In ..... 423
          In Errored ..... 0
          In Dropped ..... 0
TLVs:    Unrecognized ..... 0
          Discarded ..... 0
Neighbors: New Entries ..... 20
           Deleted Entries ..... 20
           Dropped Entries ..... 0
           Entry Age-outs ..... 20
```

**Table 71:** Parameters in the output of the **show lldp statistics** command

| Parameter             | Description  |
|-----------------------|--|
| Frames Out            | Number of LLDPDU frames transmitted.   |
| Frames In             | Number of LLDPDU frames received.  |
| Frames In Errored     | Number of invalid LLDPDU frames received.  |
| Frames In Dropped     | Number of LLDPDU frames received and discarded for any reason.   |
| TLVs Unrecognized     | Number of LLDP TLVs received that are not recognized but the TLV type is in the range of reserved TLV types. |
| TLVs Discarded        | Number of LLDP TLVs discarded for any reason.  |
| Neighbors New Entries | Number of times the information advertised by neighbors has been inserted into the neighbor table.           |

**Table 71:** Parameters in the output of the **show lldp statistics** command (cont.)

| Parameter                        | Description  |
|----------------------------------|--|
| Neighbors Deleted Entries        | Number of times the information advertised by neighbors has been removed from the neighbor table.  |
| Neighbors Dropped Entries        | Number of times the information advertised by neighbors could not be entered into the neighbor table because of insufficient resources.            |
| Neighbors Entry Age-outs Entries | Number of times the information advertised by neighbors has been removed from the neighbor table because the information TTL interval has expired. |

```

| Parameter      | Description  |
|----------------|--|
| civic-location | Display civic location information.                              |
| coord-location | Display coordinate location information.                         |
| elin-location  | Display ELIN (Emergency Location Identifier Number) information. |
| <civic-loc-id> | Civic address location identifier, in the range 1 to 4095.       |
| <coord-loc-id> | Coordinate location identifier, in the range 1 to 4095.          |
| <elin-loc-id>  | ELIN location identifier, in the range 1 to 4095.                |
| <port-list>    | Ports to display information about.                              |

**Mode** User Exec and Privileged Exec

**Examples** To display a civic address location configured on port1.0.1, use the command:

```
awplus# show location civic-location interface port1.0.1
```

**Table 74:** Example output from the **show location** command

```
awplus# show location civic-location interface port1.0.1
Port      ID      Element Type      Element Value
-----
1.0.1     1      Country           NZ
          City           Christchurch
          Street-suffix   Avenue
          House-number    27
          Primary-road-name Nazareth
```

To display coordinate location information configured on the identifier 1, use the command:

```
awplus# show location coord-location identifier 1
```

**Table 75:** Example output from the **show location** command

```
awplus# show location coord-location identifier 1
  ID  Element Type                Element Value
-----
  1   Latitude Resolution         15 bits
      Latitude                    38.8986481130123138427734375 degrees
      Longitude Resolution        15 bits
      Longitude                    130.2323232293128967285156250 degrees
      Altitude Resolution          10 bits
      Altitude                     2.50000000 meters
      Map Datum                    WGS 84
```

The coordinate location information displayed may differ from the information entered because it is stored in binary format. For more information, see the [location coord-location configuration](#) command.

To display all ELIN location information configured on the switch, use the command:

```
awplus# show location elin-location
```

**Table 76:** Example output from the **show location elin-location** command

```
awplus# show location elin-location
  ID  ELIN
-----
  1   1234567890
  2   5432154321
```

# Mail (SMTP) Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure mail. The mail feature uses Simple Mail Transfer Protocol (SMTP) to transfer mail from an internal email client operating within the AlliedWare Plus device. This feature is typically used to email event notifications to an external email server from the AlliedWare Plus device.

For information on using the mail feature, see the [Mail \(SMTP\) Feature Overview and Configuration Guide](#).

- Command List**
- “[debug mail](#)” on page 3888
  - “[delete mail](#)” on page 3889
  - “[mail](#)” on page 3890
  - “[mail from](#)” on page 3892
  - “[mail smtpserver](#)” on page 3893
  - “[mail smtpserver authentication](#)” on page 3894
  - “[mail smtpserver port](#)” on page 3896
  - “[show counter mail](#)” on page 3898
  - “[show mail](#)” on page 3899
  - “[undebug mail](#)” on page 3900

# debug mail

**Overview** This command turns on debugging for sending emails.  
The **no** variant of this command turns off debugging for sending emails.

**Syntax** debug mail  
no debug mail

**Mode** Privileged Exec

**Examples** To turn on debugging for sending emails, use the command:

```
awplus# debug mail
```

To turn off debugging for sending emails, use the command:

```
awplus# no debug mail
```

**Related commands**

- delete mail
- mail
- mail from
- mail smtpserver
- show counter mail
- show mail
- undebug mail

# delete mail

**Overview** This command deletes mail from the queue.

You need the *mail-id* from the **show mail** command output to delete specific emails, or use the **all** parameter to clear all messages in the queue completely.

**Syntax** `delete mail [mail-id <mail-id>|all]`

| Parameter | Description   |
|-----------|---|
| mail-id   | Deletes a single mail from the mail queue.  |
|           | <mail-id> A unique mail ID number. Use the <a href="#">show mail</a> command to display this for an item of mail. |
| all       | Delete all the mail in the queue.   |

**Mode** Privileged Exec

**Examples** To delete the unique mail item "20060912142356.1234" from the queue, use the command:

```
awplus# delete mail 20060912142356.1234
```

To delete all mail from the queue, use the command:

```
awplus# delete mail all
```

**Related commands**

- [debug mail](#)
- [mail](#)
- [mail from](#)
- [mail smtpserver](#)
- [show mail](#)

# mail

**Overview** This command sends an email using the SMTP protocol. If you specify a file the text inside the file is sent in the message body.

If you do not specify the **to**, **file**, or **subject** parameters, the CLI prompts you for the missing information.

Before you can send mail using this command, you must specify the sending email address using the [mail from](#) command and a mail server using the [mail smtpserver](#) command.

**Syntax** mail [to <to>] [subject <subject>] [file <filename>]

| Parameter | Description   |
|-----------|---|
| to        | The email recipient.<br><br><to> Email address.   |
| subject   | Description of the subject of this email. Use quote marks when the subject text contains spaces.<br><br><subject> String. |
| file      | File to insert as text into the message body.<br><br><filename> String.   |

**Mode** Privileged Exec

**Usage notes** When you use the **mail** command you can use parameter substitutions in the subject field. The following table lists the parameters that can be substituted and their descriptions:

| Parameter            | Description  |
|----------------------|--|
| <%N>                 | When this parameter is specified, the %N is replaced by the host name of your device.                                  |
| <%S>                 | When this parameter is specified, the %S is replaced by the serial number of your device.                              |
| <%D><br><%L><br><%T> | When any of these parameters is specified, they are replaced by the current date and time (local time) on your device. |
| <%U>                 | When this parameter is specified, the %U is replaced by the current date and time (UTC time) on your device.           |

**NOTE:** If no local time is configured, it will use UTC.

**Examples** To send an email to "admin@example.com" with the subject "test email" and with the message body inserted from the file "test.conf", use the command:

```
awplus# mail to admin@example.com subject "test email" filename  
test.conf
```

To send an email using parameter substitutions for the host name, serial number and date, use the commands:

```
awplus# mail to admin@example.com subject "Sending email from  
Hostname:%N Serial Number:%S Date:%T"
```

[show counter mail](#)

[show mail](#)

# mail from

**Overview** This command sets an email address as the sender. You must specify a sending email address with this command before you can send email.

Use the **no** variant of this command to remove the “mail from” address.

**Syntax** mail from <from>  
no mail from

| Parameter | Description  |
|-----------|--|
| <from>    | The email address that the mail is sent from (also known as the hostname). |

**Mode** Global Configuration

**Example** To set up your email address as the sender “kaji@nerv.com”, use the command:

```
awplus(config)# mail from kaji@nerv.com
```

**Related commands**

- debug mail
- delete mail
- mail
- mail smtpserver
- show counter mail

- undebug mail

# mail smtpserver

**Overview** This command specifies the IP address or domain name of the SMTP server that your device sends email to. You must specify a mail server with this command before you can send email.

Use the **no** variant of this command to remove the configured mail server.

**Syntax** mail smtpserver {<ip-address>|<name>}  
no mail smtpserver

| Parameter    | Description   |
|--------------|---|
| <ip-address> | Internet Protocol (IP) address for the mail server.                   |
| <name>       | Domain name (FQDN) for the mail server (also known as the host name). |

**Mode** Global Configuration

**Usage notes** If you specify the server by specifying its domain name, you must also ensure that the DNS client on your device is enabled. It is enabled by default but if it has been disabled, you can re-enable it by using the [ip domain-lookup](#) command.

**Examples** To specify a mail server at "192.168.0.1", use the command:

```
awplus(config)# mail smtpserver 192.168.0.1
```

To specify a mail server that has a host name of "smtp.example.com", use the command:

```
awplus(config)# mail smtpserver smtp.example.com
```

To remove the configured mail server, use the command:

```
awplus(config)# no mail smtpserver
```

**Related commands**

# mail smtpserver authentication

**Overview** Use this command to configure SMTP mail server authentication.

Use the **no** variant of this command to remove the configured SMTP mail server authentication.

**Syntax** mail smtpserver authentication {crammd5|login|plain} username <username> password [8] <password>  
no mail smtpserver authentication

| Parameter  | Description  |
|------------|--|
| crammd5    | This is a Challenge Request Authentication Mechanism based on the HMAC-MD5 mechanism and is the most secure option.  |
| login      | A BASE64 encryption method   |
| plain      | A BASE64 encryption method   |
| <username> | Registered user name   |
| 8          | The registered user password is presented in an already encrypted format. This is how the running configuration stores the plain text password and is not for general use. |
| <password> | Registered user password   |

**Default** No authentication option is set by default.

**Mode** Global Configuration

**Usage notes** You cannot change the IP address or Domain Name of the SMTP server if authentication is configured. If you attempt to change it when authentication is configured, the following error message is displayed:

```
% Error: authentication configuration still exists
```

**Examples** To configure the SMTP mail server authentication to crammd5, use the commands:

```
awplus# configure terminal  
awplus(config)# mail smtpserver authentication crammd5 username  
admin password unguessablePassword
```

To remove SMTP mail server authentication, use the commands:

```
awplus# configure terminal  
awplus(config)# no mail smtpserver authentication
```

**Output** Figure 68-1: Example output from **show mail**:

```
awplus#show mail
Mail Settings
-----
State                : Alive
SMTP Server          : 1.2.3.4
Host Name             : admin@example.com
Authentication        : crammd5
Username              : admin
Debug                 : Disabled

awplus#show running-config

changes**

Version 5.4.8-1.1: command added

# mail smtpserver port

**Overview** Use this command to configure the SMTP mail client/server communication port. Use the **no** variant of this command to remove the configured port and set it back to the default port 25.

**Syntax** mail smtpserver port <port>  
no mail smtpserver port

| Parameter | Description                           |
|-----------|---------------------------------------|
| <port>    | Port number from the range 1 to 65535 |

**Default** Port 25 is the default port.

**Mode** Global Configuration

**Examples** To configure the mail server communication over port 587, use the commands:

```
awplus# configure terminal
awplus(config)# mail smtpserver port 587
```

To remove the configured port and set it back to the default port 25, use the commands:

```
awplus# configure terminal
awplus(config)# no mail smtpserver port
```

**Output** Figure 68-2: Example output from **show mail**:

```
awplus#show mail
Mail Settings
-----
State                : Alive
SMTP Server          : 10.24.165.4
Host Name             : admin@example.com
Authentication       : plain
Username              : admin
Port                  : 587
Debug                 : Disabled

awplus#show running-config
!
mail smtpserver port 587
!
```

# show counter mail

**Overview** This command displays the mail counters.

**Syntax** `show counter mail`

**Mode** User Exec and Privileged Exec

**Example** To show the emails in the queue use the command:

```
awplus# show counter mail
```

**Output** Figure 68-3: Example output from the **show counter mail** command

```
Mail Client (SMTP) counters
Mails Sent           ..... 2
Mails Sent Fails     ..... 1
```

**Table 1:** Parameters in the output of the **show counter mail** command

| Parameter        | Description   |
|------------------|---|
| Mails Sent       | The number of emails sent successfully since the last device restart.         |
| Mails Sent Fails | The number of emails the device failed to send since the last device restart. |

# RMON Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Remote Monitoring (RMON).

For an introduction to RMON and an RMON configuration example, see the [RMON Feature Overview and Configuration Guide](#).

RMON is disabled by default in AlliedWare Plus™. No RMON alarms or events are configured.

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

- Command List**
- [“rmon alarm”](#) on page 3902
  - [“rmon collection history”](#) on page 3905
  - [“rmon collection stats”](#) on page 3906
  - [“rmon event”](#) on page 3907
  - [“show rmon alarm”](#) on page 3908
  - [“show rmon event”](#) on page 3909
  - [“show rmon history”](#) on page 3911
  - [“show rmon statistics”](#) on page 3913

# rmon alarm

**Overview** Use this command to configure an RMON alarm to monitor the value of an SNMP object, and to trigger specified events when the monitored object crosses specified thresholds.

To specify the action taken when the alarm is triggered, use the event index of an event defined by the [rmon event](#) command.

Use the **no** variant of this command to remove the alarm configuration.

**NOTE:** You can only configure alarms for switch port interfaces, not for VLANs.

**Syntax** **User-defined alarm:**

```
rmon alarm <alarm-index> <oid.index> interval <1-2147483647>
{delta|absolute} rising-threshold <1-2147483647> event
<rising-event-index> falling-threshold <1-2147483647> event
<falling-event-index> [alarmstartup {1|2|3}] [owner <owner>]
```

**Eventwatch alarm, do not use (used by Vista Manager EX only):**

```
rmon alarm <alarm-index> <oid.index> interval <1-4294967295>
{delta|absolute} rising-threshold <1-2147483647> event
eventwatch falling-threshold <1-2147483647> event eventwatch
[owner <owner>]
```

```
no rmon alarm <alarm-index>
```

| Parameter                  | Description   |
|----------------------------|---|
| <alarm-index>              | Alarm entry index value from the range 1 to 65535 seconds.  |
| <oid.index>                | The variable SNMP MIB Object Identifier (OID) name to be monitored, for either etherStats or etherHistory entries. The entries can be either of the following formats:<br>- etherStatsEntry.<field>.<stats-index> or etherHistoryEntry.<field>.<history-index>, or<br>- etherStatsFieldName.<stats-index> or etherHistoryFieldName.<history-index>.<br>To define the <stats-index>, use the <a href="#">rmon collection stats</a> command.<br>To define the <history-index>, use the <a href="#">rmon collection history</a> command. |
| interval<br><1-2147483647> | Polling interval in seconds from the range 1 to 2147483647.   |
| delta                      | The RMON MIB alarmSampleType: the change in the monitored MIB object value between the beginning and end of the polling interval.   |
| absolute                   | The RMON MIB alarmSampleType: the value of the monitored MIB object.  |

| Parameter                           | Description  |
|-------------------------------------|--|
| rising-threshold<br><1-2147483647>  | Rising threshold value of the alarm entry in seconds from the range 1 to 2147483647.   |
| <rising-event-index>                | From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the rising threshold value. This is the event index of an event specified by the <code>rmon event</code> command.                       |
| eventwatch                          | The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <code>&lt;rising-event-index&gt;</code> parameter instead. |
| falling-threshold<br><1-2147483647> | Falling threshold value of the alarm entry in seconds from the range 1 to 2147483647.  |
| <falling-event-index>               | From the range 1 to 65535 seconds. The event to be triggered when the monitored object value reaches the falling threshold value. This is an event index of an event specified by the <code>rmon event</code> command.                       |
| eventwatch                          | The alarm triggers an eventwatch event. This mechanism is used by Vista Manager EX, the Allied Telesis network management and monitoring tool. Do not use this parameter; use the <code>&lt;rising-event-index&gt;</code> parameter instead. |
| alarmstartup {1 2 3}                | Whether RMON can trigger a falling alarm (1), a rising alarm (2) or either (3) when you first start monitoring. See the Usage section for more information. The default is setting 3 (either).   |
| owner <owner>                       | Arbitrary owner name to identify the alarm entry.  |

**Default** By default, there are no alarms.

**Mode** Global Configuration

**Usage notes** RMON alarms have a rising and falling threshold. Once the alarm monitoring is operating, you cannot have a falling alarm unless there has been a rising alarm and vice versa.

However, when you start RMON alarm monitoring, an alarm must be generated without the other type of alarm having first been triggered. The **alarmstartup** parameter allows this. It is used to say whether RMON can generate a rising alarm (1), a falling alarm (2) or either alarm (3) as the first alarm.

Note that you specify the SNMP MIB Object Identifier (OID) as a dotted decimal value, using one of the following forms:

- etherStatsEntry.<field>.<stats-index> or etherHistoryEntry.<field>.<history-index>. For example, etherHistoryEntry.8.8

- or, etherStatsFieldName.<stats-index> or etherHistoryFieldName.<history-index>. For example, etherHistoryMulticastPkts.8

If you enter the first form (etherHistoryEntry.8.8), the device will save it as the second form (etherHistoryMulticastPkts.8) in the running-config.

**Example** To configure an alarm to:

- monitor the change per minute in the etherStatsPkt value for interface 22 (defined by stats-index 22 in the [rmon collection stats](#) command)
- and trigger event 2 (defined by the [rmon event](#) command) when the change reaches the rising threshold 400
- and trigger event 3 when it reaches the falling threshold 200
- and identify this alarm as belonging to the user with username Maria

use the following commands:

```
awplus# configure terminal
awplus(config)# rmon alarm 229 etherStatsEntry.22.5 interval 60
delta rising-threshold 400 event 2 falling-threshold 200 event
3 alarmstartup 3 owner maria
```

To configure an alarm that:

- every 10 seconds, checks the number of multicast packets
- in the latest history control table entry controlled by history-index 8
- to see if the number of packets has increased to 15 or dropped to 5
- and if it has, trigger event 10

use either of the following commands:

```
awplus(config)# rmon alarm 56 etherHistoryMulticastPkts.8
interval 10 absolute rising-threshold 15 event 10
falling-threshold 5 event 10

awplus(config)# rmon alarm 56 etherHistoryEntry.8.8 interval 10
absolute rising-threshold 15 event 10 falling-threshold 5 event
10
```

**Related commands** [rmon collection history](#)  
[rmon collection stats](#)  
[rmon event](#)

# rmon collection history

**Overview** Use this command to create a history statistics control group to store a specified number of snapshots (buckets) of the standard RMON statistics for the switch port, and to collect these statistics at specified intervals. If there is sufficient memory available, then the device will allocate memory for storing the set of buckets that comprise this history control.

Use the **no** variant of this command to remove the specified history control configuration.

**NOTE:** A history can only be collected for switch port interfaces, not for VLANs.

**Syntax** `rmon collection history <history-index> [buckets <1-65535>]  
[interval <1-3600>] [owner <owner>]  
no rmon collection history <history-index>`

| Parameter         | Description  |
|-------------------|--|
| <history-index>   | A unique RMON history control entry index value from the range 1 to 65535.                           |
| buckets <1-65535> | Number of requested buckets to store snapshots from the range 1 to 65535. The default is 50 buckets. |
| interval <1-3600> | Polling interval in seconds. Default 1800 second polling interval from the range 1 to 3600.          |
| owner <owner>     | Owner name to identify the entry.  |

**Default** The default interval is 1800 seconds and the default number of buckets is 50.

**Mode** Interface Configuration

**Example** To create a history statistics control group with ID 200 to store 500 snapshots with an interval of 600 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection history 200 buckets 500
interval 600 owner herbert
```

To disable the history statistics control group, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection history 200
```

**Related commands** [rmon alarm](#)  
[rmon collection stats](#)  
[rmon event](#)

# rmon collection stats

**Overview** Use this command to enable the collection of RMON statistics on a switch port, and assign an index number by which to access these collected statistics.

Use the **no** variant of this command to stop collecting RMON statistics on this switch port.

**NOTE:** *Statistics can only be collected for switch port interfaces, not for VLANs.*

**Syntax** `rmon collection stats <collection-index> [owner <owner>]`  
`no rmon collection stats <collection-index>`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;collection-index&gt;</code> | Give this collection of statistics an index number to uniquely identify it. This is the index to use to access the statistics collected for this switch port. Use a number in the range of 1 to 65535. |
| <code>owner &lt;owner&gt;</code>      | An arbitrary owner name to identify this statistics collection entry.  |

**Default** RMON statistics are not enabled by default.

**Mode** Interface Configuration

**Example** To enable the collection of RMON statistics with a statistics index of 200, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# rmon collection stats 200 owner myrtle
```

To stop collecting RMON statistics, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.2
awplus(config-if)# no rmon collection stats 200
```

**Related commands** [rmon alarm](#)  
[rmon collection history](#)  
[rmon event](#)

# rmon event

**Overview** Use this command to create an event definition for a log or a trap or both. Then you can use this event index in the [rmon alarm](#) command to indicate whether to send an SNMP trap or log message (or both) when an alarm is triggered.

Use the **no** variant of this command to remove the event definition.

**Syntax**

```
rmon event <event-index> [description <description>|owner <owner>| trap <trap>]
```

```
rmon event <event-index> [log [description <description>|owner <owner>|trap <trap>] ]
```

```
rmon event <event-index> [log trap [description <description>|owner <owner>] ]
```

```
no rmon event <event-index>
```

| Parameter                | Description                               |
|--------------------------|---|
| <event-index>            | <1-65535> Unique event entry index value. |
| log                      | Log event type.                           |
| trap                     | Trap event type.                          |
| log trap                 | Log and trap event type.                  |
| description<description> | Event entry description.                  |
| owner <owner>            | Owner name to identify the entry.         |

**Default** No event is configured by default.

**Mode** Global Configuration

**Example** To create an event definition with an index of 299 for a log, use this command:

```
awplus# configure terminal
awplus(config)# rmon event 299 log description cond3 owner
alfred
```

To remove the event definition, use the command:

```
awplus# configure terminal
awplus(config)# no rmon event 299
```

**Related commands** [rmon alarm](#)

# show rmon alarm

**Overview** Use this command to display the alarms and threshold configured for the RMON probe.

**Syntax** `show rmon alarm`

**Mode** User Exec and Privileged Exec

**Example** To display the alarms and threshold, use this command:

```
awplus# show rmon alarm
```

**Related commands** [rmon alarm](#)

# show rmon event

**Overview** Use this command to display the events configured for the RMON probe.

**Syntax** show rmon event

**Mode** User Exec and Privileged Exec

**Output** Figure 69-1: Example output from the **show rmon event** command

```
awplus#sh rmon event
event Index = 787
  Description TRAP
  Event type log & trap
  Event community name gopher
  Last Time Sent = 0
  Owner RMON_SNMP

event Index = 990
  Description TRAP
  Event type trap
  Event community name teabo
  Last Time Sent = 0
  Owner RMON_SNMP
```

# banner login (SSH)

**Overview** This command configures a login banner on the SSH server. This displays a message on the remote terminal of the SSH client before the login prompt. SSH client version 1 does not support this banner.

To add a banner, first enter the command **banner login**, and hit [Enter]. Write your message. You can use any character and spaces. Use Ctrl+D at the end of your message to save the text and re-enter the normal command line mode.

The banner message is preserved if the device restarts.

The **no** variant of this command deletes the login banner from the device.

**Syntax** banner login  
no banner login

**Default** No banner is defined by default.

**Mode** Global Configuration

**Examples** To set a login banner message, use the commands:

```
awplus# configure terminal  
awplus(config)# banner login
```

The screen will prompt you to enter the message:

Type CNTL/D to finish.

... banner message comes here ...

Enter the message. Use Ctrl+D to finish, like this:

```
^D  
awplus(config)#
```

To remove the login banner message, use the commands:

```
awplus# configure terminal  
awplus(config)# no banner login
```

**Related commands** [show banner login](#)

# clear ssh

**Overview** This command deletes Secure Shell sessions currently active on the device. This includes both incoming and outgoing sessions. The deleted sessions are closed. You can only delete an SSH session if you are a system manager or the user who initiated the session. If **all** is specified then all active SSH sessions are deleted.

**Syntax** `clear ssh {<1-65535>|all}`

| Parameters | Description  |
|------------|--|
| <1-65535>  | Specify a session ID in the range 1 to 65535 to delete a specific session. |
| all        | Delete all SSH sessions.   |

**Mode** Privileged Exec

**Examples** To stop the current SSH session 123, use the command:

```
awplus# clear ssh 123
```

To stop all SSH sessions active on the device, use the command:

```
awplus# clear ssh all
```

**Related commands** [service ssh](#)  
[ssh](#)

# crypto key destroy hostkey

**Overview** This command deletes the existing public and private keys of the SSH server.

**Syntax** `crypto key destroy hostkey {dsa|ecdsa|rsa|rsa1}`

| Parameters | Description  |
|------------|--|
| dsa        | Deletes the existing DSA public and private keys.  |
| ecdsa      | Deletes the existing ECDSA public and private keys.  |
| rsa        | Deletes the existing RSA public and private keys configured for SSH version 2 connections.   |
| rsa1       | Deletes the existing RSA public and private keys configured for SSH version 1 connections. From AlliedWare Plus version 5.5.1-1.1 onwards, SSH version 1 is not supported. |

**Mode** Global Configuration

**Example** To destroy the RSA host key used for SSH version 2 connections, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy hostkey rsa
```

**Related commands** [crypto key generate hostkey](#)  
[service ssh](#)

# crypto key destroy userkey

**Overview** This command destroys the existing public and private keys of an SSH user configured on the device.

**Syntax** `crypto key destroy userkey <username> {dsa|rsa|rsa1}`

| Parameters                    | Description  |
|-------------------------------|--|
| <code>&lt;username&gt;</code> | Name of the user whose userkey you are destroying. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| <code>dsa</code>              | Deletes the existing DSA userkey.  |
| <code>rsa</code>              | Deletes the existing RSA userkey configured for SSH version 2 connections.   |
| <code>rsa1</code>             | Deletes the existing RSA userkey for SSH version 1 connections.  |

**Mode** Global Configuration

**Example** To destroy the RSA user key for the SSH user `remoteuser`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key destroy userkey remoteuser rsa
```

**Related commands**

- [crypto key generate hostkey](#)
- [show ssh](#)
- [show crypto key hostkey](#)

# crypto key generate hostkey

**Overview** This command generates public and private keys for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use this command to generate that key before you enable the SSH server. If a host key exists with the same cryptography algorithm, this command replaces the old host key with the new key.

For maximum security in secure mode, we recommend using ECDSA host keys.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate hostkey rsa [<768-32768>]`  
`crypto key generate hostkey ecdsa [<256|384>]`

| Parameters                     | Description                              |
|--------------------------------|--|
| <code>rsa</code>               | Creates an RSA hostkey.                  |
| <code>ecdsa</code>             | Creates an ECDSA hostkey.                |
| <code>&lt;768-32768&gt;</code> | The length in bits of the generated key. |
| <code>&lt;256 384&gt;</code>   | The ECDSA key size in bits.              |

**Default** The default key length for RSA is 1024 bits, except in secure mode. In secure mode, the default key length for RSA is 2048 bits.

The default key size for ECDSA is 256 bits.

**Mode** Global Configuration

**Examples** To generate an RSA host key that is 2048 bits in length, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey rsa 2048
```

To generate an ECDSA host key with an elliptic curve size of 384 bits, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate hostkey ecdsa 384
```

**Related commands** [crypto key destroy hostkey](#)  
[service ssh](#)  
[show crypto key hostkey](#)

**Command changes** Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# crypto key generate userkey

**Overview** This command generates public and private keys for an SSH user using either an RSA or ECDSA cryptography algorithm. To use public key authentication, copy the public key of the user onto the remote SSH server.

This command is not saved in the device configuration. However, the device saves the keys generated by this command in the non-volatile memory.

**Syntax** `crypto key generate userkey <username> rsa [<768-32768>]`  
`crypto key generate userkey <username> ecdsa [<256|384>]`

| Parameters  | Description  |
|-------------|--|
| <username>  | Name of the user that the user key is generated for. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| rsa         | Creates an RSA userkey for SSH version 2 connections.  |
| ecdsa       | Creates an ECDSA hostkey. Both SSH version 1 and 2 connections can use the ECDSA hostkey.  |
| <768-32768> | The length in bits of the generated key. The default is 1024 bits.   |
| <256 384>   | The ECDSA key size in bits. The default is 256, but it can be set to 384.  |

**Mode** Global Configuration

**Examples** To generate a 2048-bits RSA user key for SSH version 2 connections for the user "bob", use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey bob rsa 2048
```

To generate an ECDSA user key of key size 384 for the user "lapo", use the commands:

```
awplus# configure terminal
awplus(config)# crypto key generate userkey lapo ecdsa 384
```

**Related commands** [crypto key pubkey-chain userkey](#)  
[show crypto key userkey](#)

# crypto key pubkey-chain knownhosts

**Overview** This command adds a public key of the specified SSH server to the known host database on your device. The SSH client on your device uses this public key to verify the remote SSH server.

The key is retrieved from the server. Before adding a key to this database, check that the key sent to you is correct.

If the server's key changes, or if your SSH client does not have the public key of the remote SSH server, then your SSH client will inform you that the public key of the server is unknown or altered.

The **no** variant of this command deletes the public key of the specified SSH server from the known host database on your device.

**Syntax** `crypto key pubkey-chain knownhosts [ip|ipv6] <hostname> [ecdsa|rsa]`  
`no crypto key pubkey-chain knownhosts <1-65535>`

**Syntax (VRF-lite)** `crypto key pubkey-chain knownhosts [vrf <vrf-name>] [ip|ipv6] <hostname> [ecdsa|rsa]`  
`no crypto key pubkey-chain knownhosts [vrf <vrf-name>] <1-65535>`

| Parameter  | Description  |
|------------|--|
| vrf        | Apply this command to the specified VRF instance.  |
| <vrf-name> | The VRF instance name  |
| ip         | Keyword used prior to specifying an IPv4 address   |
| ipv6       | Keyword used prior to specifying an IPv6 address   |
| <hostname> | IPv4/IPv6 address or hostname of a remote server in the format a.b.c.d for an IPv4 address, or in the format x:x::x:x for an IPv6 address. |
| ecdsa      | Specify the ECDSA public key of the server to be added to the known host database.   |
| rsa        | Specify the RSA public key of the server to be added to the known host database.   |
| <1-65535>  | Specify a key identifier when removing a key using the <b>no</b> parameter.  |

**Default** If no cryptography algorithm is specified, then **rsa** is used as the default cryptography algorithm.

**Mode** Privilege Exec

**Usage notes** This command adds a public key of the specified SSH server to the known host database on the device. The key is retrieved from the server. The remote SSH server is verified by using this public key. The user is requested to check the key is correct before adding it to the database.

If the remote server's host key is changed, or if the device does not have the public key of the remote server, then SSH clients will inform the user that the public key of the server is altered or unknown.

**Examples** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts 192.0.2.11
```

To delete the second entry in the known host database, use the command:

```
awplus# no crypto key pubkey-chain knownhosts 2
```

**Examples (VRF-lite)** To add the RSA host key of the remote SSH host IPv4 address 192.0.2.11 in VRF 'red' to the known host database, use the command:

```
awplus# crypto key pubkey-chain knownhosts vrf red 192.0.2.11
```

To delete the second entry in the known host database in VRF 'red', use the command:

```
awplus# no crypto key pubkey-chain knownhosts vrf red 2
```

**Validation Commands** [show crypto key pubkey-chain knownhosts](#)

# crypto key pubkey-chain userkey

**Overview** This command adds a public key for an SSH user on the SSH server. This allows the SSH server to support public key authentication for the SSH user. When configured, the SSH user can access the SSH server without providing a password from the remote host.

The **no** variant of this command removes a public key for the specified SSH user that has been added to the public key chain. When a SSH user's public key is removed, the SSH user can no longer login using public key authentication.

**Syntax** `crypto key pubkey-chain userkey <username> [<filename>]`  
`no crypto key pubkey-chain userkey <username> <1-65535>`

| Parameters | Description  |
|------------|--|
| <username> | Name of the user that the SSH server associates the key with. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols.<br>Default: no default |
| <filename> | Filename of a key saved in flash. Valid characters are any printable character. You can add a key as a hexadecimal string directly into the terminal if you do not specify a filename.                                   |
| <1-65535>  | The key ID number of the user's key. Specify the key ID to delete a key.   |

**Mode** Global Configuration

**Usage notes** You should import the public key file from the client node. The device can read the data from a file on the flash or user terminal.

Or you can add a key as text into the terminal. To add a key as text into the terminal, first enter the command **crypto key pubkey-chain userkey <username>**, and hit [Enter]. Enter the key as text. Note that the key you enter as text must be a valid SSH RSA key, not random ASCII text. Use [Ctrl]+D after entering it to save the text and re-enter the normal command line mode.

Note you can generate a valid SSH RSA key on the device first using the **crypto key generate host rsa** command. View the SSH RSA key generated on the device using the **show crypto hostkey rsa** command. Copy and paste the displayed SSH RSA key after entering the **crypto key pubkey-chain userkey <username>** command. Use [Ctrl]+D after entering it to save it.

**Examples** To generate a valid SSH RSA key on the device and add the key, use the following commands:

```
awplus# configure terminal
awplus(config)# crypto key generate host rsa
awplus(config)# exit

awplus# show crypto key hostkey
rsaAAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768EoWhyPW6FZ2t5360O5M29EpKBmGq1kQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=

awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey joeType CNTRL/D
to
finish:AAAAB3NzaC1yc2EAAAABIwAAAIEAr1s7SokW5aW2fcOw1TStpb9J20bWluhnUC768EoWhyPW6FZ2t5360O5M29EpKBmGq1kQaz5V0mU9IQe66+5YyD4UxOKSDtTI+7jtjDcoGWHb2u4sFwRpXwJZcgYrXW16+6NvNbk+h+c/pqGDijj4SvfZZfeITzvvyZW4/I4pbN8=control-D

awplus(config)#
```

To add a public key for the user `graydon` from the file `key.pub`, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey graydon key.pub
```

To add a public key for the user `tamara` from the terminal, use the commands:

```
awplus# configure terminal
awplus(config)# crypto key pubkey-chain userkey tamara
```

and enter the key. Use Ctrl+D to finish.

To remove the first key entry from the public key chain of the user `john`, use the commands:

```
awplus# configure terminal
awplus(config)# no crypto key pubkey-chain userkey john 1
```

**Related commands** [show crypto key pubkey-chain userkey](#)

# debug ssh client

**Overview** This command enables the SSH client debugging facility. When enabled, any SSH, SCP and SFTP client sessions send diagnostic messages to the login terminal.

The **no** variant of this command disables the SSH client debugging facility. This stops the SSH client from generating diagnostic debugging message.

**Syntax** `debug ssh client [brief|full]`  
`no debug ssh client`

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH client debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH client debugging, use the command:

```
awplus# debug ssh client
```

To start SSH client debugging with extended output, use the command:

```
awplus# debug ssh client full
```

To disable SSH client debugging, use the command:

```
awplus# no debug ssh client
```

**Related commands** [debug ssh server](#)  
[show ssh client](#)  
[undebug ssh client](#)

# debug ssh server

**Overview** This command enables the SSH server debugging facility. When enabled, the SSH server sends diagnostic messages to the system log. To display the debugging messages on the terminal, use the **terminal monitor** command.

The **no** variant of this command disables the SSH server debugging facility. This stops the SSH server from generating diagnostic debugging messages.

**Syntax** `debug ssh server [brief|full]`  
`no debug ssh server`

| Parameter | Description               |
|-----------|---------------------------|
| brief     | Enables brief debug mode. |
| full      | Enables full debug mode.  |

**Default** SSH server debugging is disabled by default.

**Mode** Privileged Exec and Global Configuration

**Examples** To start SSH server debugging, use the command:

```
awplus# debug ssh server
```

To start SSH server debugging with extended output, use the command:

```
awplus# debug ssh server full
```

To disable SSH server debugging, use the command:

```
awplus# no debug ssh server
```

**Related commands** [debug ssh client](#)  
[show ssh server](#)  
[undebug ssh server](#)

# service ssh

**Overview** Use this command to enable the Secure Shell server on the device. Once enabled, connections coming from SSH clients are accepted.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

If you need a key with different parameters than this, you can use the [crypto key generate hostkey](#) command to generate that key before you enable the SSH server.

Use the **no** variant of this command to disable the Secure Shell server. When the Secure Shell server is disabled, connections from SSH, SCP, and SFTP clients are not accepted. This command does not affect existing SSH sessions. To terminate existing sessions, use the [clear ssh](#) command.

**Syntax** `service ssh [ip|ipv6]`  
`no service ssh [ip|ipv6]`

**Default** The Secure Shell server is disabled by default. Both IPv4 and IPv6 Secure Shell server are enabled when you issue **service ssh** without specifying the optional **ip** or **ipv6** parameters.

The server supports SSH version 2 only (not SSH version 1).

**Mode** Global Configuration

**Examples** To enable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh
```

To enable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ip
```

To enable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# service ssh ipv6
```

To disable both the IPv4 and the IPv6 Secure Shell server, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh
```

To disable the IPv4 Secure Shell server only, use the commands:

```
awplus# configure terminal
awplus(config)# no service ssh ip
```

To disable the IPv6 Secure Shell server only, use the commands:

```
awplus# configure terminal  
awplus(config)# no service ssh ipv6
```

Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# show banner login

**Overview** This command displays the banner message configured on the device. The banner message is displayed to the remote user before user authentication starts.

**Syntax** `show banner login`

**Mode** User Exec, Privileged Exec, Global Configuration, Interface Configuration, Line Configuration

**Example** To display the current login banner message, use the command:

```
awplus# show banner login
```

**Related commands** [banner login \(SSH\)](#)

# show crypto key hostkey

**Overview** This command displays the public keys generated on the device for the SSH server.

When you enable the SSH server, if no host keys exist, the server automatically generates SSHv2 host key pairs using ECDSA with a curve length of 384, and RSA with a 1024-bit key (unless in secure mode, when it only generates the ECDSA key).

The private key remains on the device secretly. The public key is copied to SSH clients to identify the server. This command displays the public key.

**Syntax** `show crypto key hostkey [dsa|ecdsa|rsa|rsa1]`

| Parameter | Description  |
|-----------|--|
| dsa       | Displays the DSA algorithm public key.   |
| ecdsa     | Displays the ECDSA algorithm public key.   |
| rsa       | Displays the RSA algorithm public key for SSH version 2 connections.   |
| rsa1      | Displays the RSA algorithm public key for SSH version 1 connections. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported. |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public keys generated on the device for SSH server, use the command:

```
awplus# show crypto key hostkey
```

To display the RSA public key of the SSH server, use the command:

```
awplus# show crypto key hostkey rsa
```

**Output** Figure 70-1: Example output from the **show crypto key hostkey** command

```
Type Bits Fingerprint
-----
rsa 1024 SHA256:T/sVz5OoA1HHXcov9dXzGGQg8avRUYh1psxNSUcSOvs
ecdsa 384 SHA256:qVn/KpN5X5ct5CJakxE40mPWmPvW2vIbBjF4SA2bZkM
```

**Table 1:** Parameters in output of the **show crypto key hostkey** command

| Parameter   | Description                         |
|-------------|-------------------------------------|
| Type        | Algorithm used to generate the key. |
| Bits        | Length in bits of the key.          |
| Fingerprint | Checksum value for the public key.  |

**Related commands** [crypto key destroy hostkey](#)  
[crypto key generate hostkey](#)

# show crypto key pubkey-chain knownhosts

**Overview** This command displays the list of public keys maintained in the known host database on the device.

**Syntax** `show crypto key pubkey-chain knownhosts [<1-65535>]`

**Syntax (VRF-lite)** `show crypto key pubkey-chain knownhosts [vrf <vrf-name> | global] [<1-65535>]`

| Parameter               | Description  |
|-------------------------|--|
| global                  | When VRF-lite is configured, apply the command to the global routing and forwarding table. |
| vrf                     | Apply the command to the specified VRF instance.   |
| <i>&lt;vrf-name&gt;</i> | The name of the VRF instance.  |
| <i>&lt;1-65535&gt;</i>  | Key identifier for a specific key. Displays the public key of the entry if specified.      |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Usage** When VRF-lite is configured:

- If **vrf** is specified, this command displays the known host database from the specified VRF instance.
- If **global** is specified, this command displays the known host database from the global routing environment.
- If neither **vrf** nor **global** is specified, this command displays the known host database from the global routing environment and each configured VRF.

For more information about VRF, see the [VRF Lite Feature Overview and Configuration Guide](#).

**Examples** To display public keys of known SSH servers, use the command:

```
awplus# show crypto key pubkey-chain knownhosts
```

To display the key data of the first entry in the known host data, use the command:

```
awplus# show crypto key pubkey-chain knownhosts 1
```

**Output** Figure 70-2: Example output from the **show crypto key public-chain knownhosts** command

| No | Hostname                                | Type | Fingerprint                                     |
|----|---|------|---|
| 1  | 172.16.23.1                             | rsa  | c8:33:b1:fe:6f:d3:8c:81:4e:f7:2a:aa:a5:be:df:18 |
| 2  | 172.16.23.10                            | rsa  | c4:79:86:65:ee:a0:1d:a5:6a:e8:fd:1d:d3:4e:37:bd |
| 3  | 5ffe:1053:ac21:ff00:0101:bcdf:ffff:0001 | rsa1 | af:4e:b4:a2:26:24:6d:65:20:32:d9:6f:32:06:ba:57 |

**Table 2:** Parameters in the output of the **show crypto key public-chain knownhosts** command

| Parameter   | Description                             |
|-------------|---|
| No          | Number ID of the key.                   |
| Hostname    | Host name of the known SSH server.      |
| Type        | The algorithm used to generate the key. |
| Fingerprint | Checksum value for the public key.      |

**Related commands** [crypto key pubkey-chain knownhosts](#)

# show crypto key pubkey-chain userkey

**Overview** This command displays the public keys registered with the SSH server for SSH users. These keys allow remote users to access the device using public key authentication. By using public key authentication, users can access the SSH server without providing password.

**Syntax** `show crypto key pubkey-chain userkey <username> [<1-65535>]`

| Parameter  | Description  |
|------------|--|
| <username> | User name of the remote SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| <1-65535>  | Key identifier for a specific key.   |

**Default** Display all keys.

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the public keys for the user `manager` that are registered with the SSH server, use the command:

```
awplus# show crypto key pubkey-chain userkey manager
```

**Output** Figure 70-3: Example output from the **show crypto key public-chain userkey** command

| No | Type | Bits | Fingerprint                                     |
|----|------|------|---|
| 1  | dsa  | 1024 | 2b:cc:df:a8:f8:2e:8f:a4:a5:4f:32:ea:67:29:78:fd |
| 2  | rsa  | 2048 | 6a:ba:22:84:c1:26:42:57:2c:d7:85:c8:06:32:49:0e |

**Table 3:** Parameters in the output of the **show crypto key userkey** command

| Parameter   | Description                             |
|-------------|---|
| No          | Number ID of the key.                   |
| Type        | The algorithm used to generate the key. |
| Bits        | Length in bits of the key.              |
| Fingerprint | Checksum value for the key.             |

**Related commands** [crypto key pubkey-chain userkey](#)

# show crypto key userkey

**Overview** This command displays the public keys created on this device for the specified SSH user.

**Syntax** `show crypto key userkey <username> [dsa|rsa|rsa1]`

| Parameter  | Description   |
|------------|---|
| <username> | User name of the local SSH user whose keys you wish to display. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen and full stop symbols. |
| dsa        | Displays the DSA public key.  |
| rsa        | Displays the RSA public key used for SSH version 2 connections.   |
| rsa1       | Displays the RSA key used for SSH version 1 connections.  |

**Mode** User Exec, Privileged Exec and Global Configuration

**Examples** To show the public key generated for the user, use the command:

```
awplus# show crypto key userkey manager
```

To store the RSA public key generated for the user manager to the file "user.pub", use the command:

```
awplus# show crypto key userkey manager rsa > manager-rsa.pub
```

**Output** Figure 70-4: Example output from the **show crypto key userkey** command

| Type | Bits | Fingerprint                                     |
|------|------|---|
| rsa  | 2048 | e8:d6:1b:c0:f4:b6:e6:7d:02:2e:a9:d4:a1:ca:3b:11 |
| rsa1 | 1024 | 12:25:60:95:64:08:8e:a1:8c:3c:45:1b:44:b9:33:9b |

**Table 4:** Parameters in the output of the **show crypto key userkey** command

| Parameter   | Description                             |
|-------------|---|
| Type        | The algorithm used to generate the key. |
| Bits        | Length in bits of the key.              |
| Fingerprint | Checksum value for the key.             |

**Related commands** [crypto key generate userkey](#)

# show running-config ssh

**Overview** This command displays the current running configuration of Secure Shell (SSH).

**Syntax** `show running-config ssh`

**Mode** Privileged Exec and Global Configuration

**Example** To display the current configuration of SSH, use the command:

```
awplus# show running-config ssh
```

**Output** Figure 70-5: Example output from the **show running-config ssh** command

```
!  
ssh server session-timeout 600  
ssh server login-timeout 30  
ssh server allow-users manager 192.168.1.*  
ssh server allow-users john  
ssh server deny-user john*.a-company.com  
ssh server
```

**Table 5:** Parameters in the output of the **show running-config ssh** command

| Parameter   | Description   |
|---|---|
| <code>ssh server</code>                             | SSH server is enabled.  |
| <code>ssh server v2</code>                          | SSH server is enabled and only support SSHv2.                               |
| <code>ssh server&lt;port&gt;</code>                 | SSH server is enabled and listening on the specified TCP port.              |
| <code>no ssh server scp</code>                      | SCP service is disabled.  |
| <code>no ssh server sftp</code>                     | SFTP service is disabled.   |
| <code>ssh server session-timeout</code>             | Configure the server session timeout.                                       |
| <code>ssh server login-timeout</code>               | Configure the server login timeout.   |
| <code>ssh server max-startups</code>                | Configure the maximum number of concurrent sessions waiting authentication. |
| <code>no ssh server authentication password</code>  | Password authentication is disabled.  |
| <code>no ssh server authentication publickey</code> | Public key authentication is disabled.                                      |

**Table 5:** Parameters in the output of the **show running-config ssh** command

| Parameter              | Description                                    |
|------------------------|--|
| ssh server allow-users | Add the user (and hostname) to the allow list. |
| ssh server deny-users  | Add the user (and hostname) to the deny list.  |

**Related commands**

- service ssh
- show ssh server

# show ssh

**Overview** This command displays the active SSH sessions on the device, both incoming and outgoing.

**Syntax** show ssh

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current SSH sessions on the device, use the command:

```
awplus# show ssh
```

**Output** Figure 70-6: Example output from the **show ssh** command

```
Secure Shell Sessions:
ID  Type  Mode   Peer Host      Username      State      Filename
-----
414 ssh   server 172.16.23.1   root         open
456 ssh   client 172.16.23.10 manager      user-auth
459 scp   client 172.16.23.12 root         download   example.awd
463 ssh   client 5ffe:33fe:5632:ffbb:bc35:ddee:0101:ac51
                                manager      user-auth
```

**Table 6:** Parameters in the output of the **show ssh** command

| Parameter | Description  |
|-----------|--|
| ID        | Unique identifier for each SSH session.  |
| Type      | Session type; either SSH, SCP, or SFTP.  |
| Mode      | Whether the device is acting as an SSH client (client) or SSH server (server) for the specified session. |
| Peer Host | The hostname or IP address of the remote server or client.   |
| Username  | Login user name of the server.   |

**Table 6:** Parameters in the output of the **show ssh** command (cont.)

| Parameter | Description   |   |
|-----------|---|---|
| State     | The current state of the SSH session. One of:                         |   |
|           | connecting  | The device is looking for a remote server.      |
|           | connected   | The device is connected to the remote server.   |
|           | accepted  | The device has accepted a new session.          |
|           | host-auth   | host-to-host authentication is in progress.     |
|           | user-auth   | User authentication is in progress.             |
|           | authenticated   | User authentication is complete.                |
|           | open  | The session is in progress.                     |
|           | download  | The user is downloading a file from the device. |
|           | upload  | The user is uploading a file from the device.   |
|           | closing   | The user is terminating the session.            |
| closed    | The session is closed.  |   |
| Filename  | Local filename of the file that the user is downloading or uploading. |   |

**Related commands** [clear ssh](#)

# show ssh client

**Overview** This command displays the current configuration of the Secure Shell client.

**Syntax** `show ssh client`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the current configuration for SSH clients on the login shell, use the command:

```
awplus# show ssh client
```

**Output** Figure 70-7: Example output from the **show ssh client** command

```
Secure Shell Client Configuration
-----
Port                : 22
Version             : 2,1
Connect Timeout    : 30 seconds
Session Timeout    : 0 (off)
Debug               : NONE
```

**Table 7:** Parameters in the output of the **show ssh client** command

| Parameter       | Description   |
|-----------------|---|
| Port            | SSH server TCP port where the SSH client connects to. The default is port 22.   |
| Version         | SSH server version, either "2" or "2,1". From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported.  |
| Connect Timeout | Time in seconds that the SSH client waits for an SSH session to establish. If the value is 0, the connection is terminated when it reaches the TCP timeout. |
| Debug           | Whether debugging is active on the client.  |

**Related commands** [show ssh server](#)

# show ssh server

**Overview** This command displays the current configuration of the Secure Shell server.

Note that changes to the SSH configuration affects only new SSH sessions coming from remote hosts, and does not affect existing sessions.

**Syntax** `show ssh server`

**Mode** User Exec, Privileged Exec, and Global Configuration

**Example** To display the current configuration of the Secure Shell server, use the command:

```
awplus# show ssh server
```

**Output** Figure 70-8: Example output from the **show ssh server** command

```
Secure Shell Server Configuration
-----
SSH Server                : Enabled
Protocol                  : IPv4,IPv6
Port                      : 22
Version                   : 2
Services                  : scp, sftp
User Authentication       : publickey, password
Resolve Hosts             : Disabled
Session Timeout           : 0 (Off)
Login Timeout             : 60 seconds
Maximum Authentication Tries : 6
Maximum Startups          : 10
Debug                     : NONE
Ciphers                   : aes128-cbc, aes128-ctr, aes192-ctr, aes256-ctr
KEX                       : curve25519-sha256@libssh.org,
                           ecdh-sha2-nistp256, ecdh-sha2-nistp384,
                           ecdh-sha2-nistp521,
                           diffie-hellman-group-exchange-sha256,
                           diffie-hellman-group-exchange-sha1,
                           diffie-hellman-group14-sha1
```

**Table 8:** Parameters in the output of the **show ssh server** command

| Parameter  | Description  |
|------------|--|
| SSH Server | Whether the Secure Shell server is enabled or disabled.  |
| Port       | TCP port where the Secure Shell server listens for connections. The default is port 22.                          |
| Version    | SSH server version; either '2' or '2,1'. From AlliedWare Plus 5.5.1-1.1 onwards, SSH version 1 is not supported. |
| Services   | List of the available Secure Shell services; one or more of SHELL, SCP or SFTP.                                  |

**Table 8:** Parameters in the output of the **show ssh server** command (cont.)

| Parameter           | Description  |
|---------------------|--|
| User Authentication | List of available authentication methods.  |
| Login Timeout       | Time (in seconds) that the SSH server will wait the SSH session to establish. If the value is 0, the client login will be terminated when TCP timeout reaches.                       |
| Idle Timeout        | Time (in seconds) that the SSH server will wait to receive data from the SSH client. The server disconnects if this timer limit is reached. If set at 0, the idle timer remains off. |
| Maximum Startups    | The maximum number of concurrent connections that are waiting authentication. The default is 10.   |
| Debug               | Whether debugging is active on the server.   |
| Ciphers             | List of ciphers permitted.   |
| KEX                 | List of available Key Exchange algorithms.   |

**Related commands** [show ssh](#)  
[show ssh client](#)

# show ssh server allow-users

**Overview** This command displays the user entries in the allow list of the SSH server.

**Syntax** `show ssh server allow-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the allow list of the SSH server, use the command:

```
awplus# show ssh server allow-users
```

**Output** Figure 70-9: Example output from the **show ssh server allow-users** command

| Username | Remote Hostname (pattern) |
|----------|---------------------------|
| awplus   | 192.168.*                 |
| john     |                           |
| manager  | *.alliedtelesis.com       |

**Table 9:** Parameters in the output of the **show ssh server allow-users** command

| Parameter                 | Description   |
|---------------------------|---|
| Username                  | User name that is allowed to access the SSH server.   |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is allowed requests from a host that matches this pattern. If no hostname is specified, the user is allowed from all hosts. |

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# show ssh server deny-users

**Overview** This command displays the user entries in the deny list of the SSH server. The user in the deny list is rejected to access the SSH server. If a user is not included in the access list of the SSH server, the user is also rejected.

**Syntax** `show ssh server deny-users`

**Mode** User Exec, Privileged Exec and Global Configuration

**Example** To display the user entries in the deny list of the SSH server, use the command:

```
awplus# show ssh server deny-users
```

**Output** Figure 70-10: Example output from the **show ssh server deny-users** command

| Username | Remote Hostname (pattern) |
|----------|---------------------------|
| john     | *.b-company.com           |
| manager  | 192.168.2.*               |

**Table 10:** Parameters in the output of the **show ssh server deny-user** command

| Parameter                 | Description   |
|---------------------------|---|
| Username                  | The user that this rule applies to.   |
| Remote Hostname (pattern) | IP address or hostname pattern of the remote client. The user is denied requests from a host that matches this pattern. If no hostname is specified, the user is denied from all hosts. |

**Related commands** [ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh

**Overview** Use this command to initiate a Secure Shell connection to a remote SSH server.

If the server requests a password to login, you need to type in the correct password at the "Password:" prompt.

An SSH client identifies the remote SSH server by its public key registered on the client device. If the server identification is changed, server verification fails. If the public key of the server has been changed, the public key of the server must be explicitly added to the known host database.

**NOTE:** A hostname specified with SSH cannot begin with a hyphen (-) character.

**Syntax** `ssh [ip|ipv6] [user <username>|port <1-65535>|version 2] <remote-device> [<command>]`

**Syntax in secure mode**

```
ssh [cipher
{aes128-cbc|aes256-cbc|aes128-ctr|aes192-ctr|aes256-ctr}]
[hmac {hmac-sha2-256}]
[public-key {ecdsa-sha2-nistp256|ecdsa-sha2-nistp384}]
[key-exchange {ecdh-sha2-nistp256|ecdh-sha2-nistp384}]
[ip|ipv6] [user <username>|port <1-65535>|version 2]
<remote-device> [<command>]
```

**Syntax (VRF-lite)** `ssh vrf <vrf-name> [ip|ipv6] [user <username>|port <1-65535>|version 2] <remote-device> [<command>]`

| Parameter    | Description   |
|--------------|---|
| cipher       | The supported cipher name.<br>Select either: aes128-cbc or aes256-cbc.  |
| hmac         | The supported hmac name: hmac-sha2-256  |
| public-key   | The supported public-key name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384  |
| key-exchange | The supported key-exchange name.<br>Select either:<br>ecdsa-sha2-nistp256 or ecdsa-sha2-nistp384  |
| vrf          | Apply the command to the specified VRF instance. When using VRF, specifying a VRF name means the command will apply to that VRF instance, and not specifying a VRF name means the command will apply to the global VRF. |
| <vrf-name>   | The name of the VRF instance.   |
| ip           | Specify IPv4 SSH.   |
| ipv6         | Specify IPv6 SSH.   |

| Parameter       | Description   |
|-----------------|---|
| user            | Login user. If user is specified, the username is used for login to the remote SSH server when user authentication is required. Otherwise the current user name is used.<br><br><username> User name to login on the remote server.                 |
| port            | SSH server port. If port is specified, the SSH client connects to the remote SSH server with the specified TCP port. Otherwise, the client port configured by "ssh client" command or the default TCP port (22) is used.<br><br><1-65535> TCP port. |
| version         | SSH client version. From 5.5.1-1.1 onwards, SSH only supports version 2.  |
| <remote-device> | IPv4/IPv6 address or hostname of a remote server. The address is in the format A.B.C.D for an IPv4 address, or in the format X:X::X:X for an IPv6 address. Note that a hostname specified with SSH cannot begin with a hyphen (-) character.        |
| <command>       | A command to execute on the remote server. If a command is specified, the command is executed on the remote SSH server and the session is disconnected when the remote command finishes.  |

**Mode** User Exec and Privileged Exec

**Usage notes** This command contains some additional security parameters (cipher, hmac, public-key, and key exchange). To access these parameters you must enable Secure Mode on the device by using the command: **crypto secure-mode**.

```
awplus(config)# crypto secure-mode
```

**Examples** To login to the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 as user 'manager', use the command:

```
awplus# ssh ip user manager 192.0.2.5
```

To login to the remote SSH server at 192.0.2.5 that is listening on TCP port 2000, use the command:

```
awplus# ssh port 2000 192.0.2.5
```

To login to the remote SSH server 'example\_host' using an IPv6 session, use the command:

```
awplus# ssh ipv6 example_host
```

To run the **cmd** command on the remote SSH server at 192.0.2.5, use the command:

```
awplus# ssh ip 192.0.2.5 cmd
```

**Example (VRF-lite)** To login to the remote SSH server at 192.168.1.1 on VRF "red", use the command:

```
awplus# ssh vrf red 192.168.1.1
```

**Related commands**

- crypto key generate userkey
- crypto secure-mode
- crypto key pubkey-chain knownhosts
- debug ssh client
- ssh client

**Command changes**

- Version 5.4.6-2.1: VRF-lite support added for AR-Series devices.
- Version 5.4.8-1.2: secure mode syntax added for x220, x930, x550, XS900MX.
- Version 5.4.8-2.1: secure mode syntax added for x950, SBx908 GEN2.
- Version 5.5.1-1.1: support removed for SSH protocol v1

# ssh client

**Overview** This command modifies the default configuration parameters of the Secure Shell (SSH) client. The configuration is used for any SSH client on the device to connect to remote SSH servers. Any parameters specified on SSH client explicitly override the default configuration parameters.

The change affects the current user shell only. When the user exits the login session, the configuration does not persist. This command does not affect existing SSH sessions.

The **no** variant of this command resets configuration parameters of the Secure Shell (SSH) client changed by the `ssh client` command, and restores the defaults.

This command does not affect the existing SSH sessions.

**Syntax**

```
ssh client {port <1-65535>|version 2|session-timeout <0-3600>|connect-timeout <1-600>}
no ssh client {port|version|session-timeout|connect-timeout}
```

| Parameter       | Description   |
|-----------------|---|
| port            | The default TCP port of the remote SSH server. If an SSH client specifies an explicit port of the server, it overrides the default TCP port.<br>Default: 22   |
|                 | <1-65535> TCP port number.  |
| version         | The SSH version used by the client for SSH sessions.<br>From 5.5.1-1.1 onwards, the SSH client supports only version 2  |
| session-timeout | The global session timeout for SSH sessions. If the session timer lapses since the last time an SSH client received data from the remote server, the session is terminated. If the value is 0, then the client does not terminate the session. Instead, the connection is terminated when it reaches the TCP timeout.<br>Default: 0 (session timer remains off) |
|                 | <0-3600> Timeout in seconds.  |
| connect-timeout | The maximum time period that an SSH session can take to become established. The SSH client terminates the SSH session if this timeout expires and the session is still not established.<br>Default: 30  |
|                 | <1-600> Timeout in seconds.   |

**Mode** Privileged Exec

**Examples** To configure the default TCP port for SSH clients to 2200, and the session timer to 10 minutes, use the command:

```
awplus# ssh client port 2200 session-timeout 600
```

To configure the connect timeout of SSH client to 10 seconds, use the command:

```
awplus# ssh client connect-timeout 10
```

To restore the connect timeout to its default, use the command:

```
awplus# no ssh client connect-timeout
```

**Related commands** [show ssh client](#)  
[ssh](#)

**Command changes** Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# ssh server

**Overview** Use this command to modify the configuration of the SSH server. Changing these parameters affects new SSH sessions connecting to the device.

Use the **no** variant of this command to restore the configuration of a specified parameter to its default. The change affects the SSH server immediately if the server is running. Otherwise, the configuration is used when the server starts.

To enable the SSH server, use the [service ssh](#) command.

**Syntax**

```
ssh server {[v1v2|v2only]|<1-65535>}
ssh server {[session-timeout <0-3600>] [login-timeout <1-600>]
[max-startups <1-128>]}
no ssh server {[session-timeout] [login-timeout]
[max-startups]}
```

| Parameter       | Description  |
|-----------------|--|
| v1v2            | Supports both SSHv2 and SSHv1 client connections.<br>Default: v1v2   |
| v2only          | Supports SSHv2 client connections only.  |
| <1-65535>       | The TCP port number that the server listens to for incoming SSH sessions.<br>Default: 22   |
| session-timeout | The maximum time period that the server waits before deciding that a session is inactive and should be terminated. The server considers the session inactive when it has not received any data from the client, and when the client does not respond to keep alive messages.<br>Default: 0 (session timer remains off).<br><br>Enter a timeout between 0-3600 seconds. |
| login-timeout   | The maximum time period the server waits before disconnecting an unauthenticated client.<br>Default: 60<br><br>Enter a timeout between 1- 600 seconds.   |
| max-startups    | The maximum number of concurrent unauthenticated connections the server accepts. When the number of SSH connections awaiting authentication reaches the limit, the server drops any additional connections until authentication succeeds or the login timer expires for a connection.<br>Default: 10<br><br>Enter a number of sessions in the range of 1-128.          |

**Mode** Global Configuration

**Examples** To configure the session timer of SSH server to 10 minutes (600 seconds), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server session-timeout 600
```

To configure the login timeout of SSH server to 30 seconds, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server login-timeout 30
```

To limit the number of SSH client connections waiting for authentication from SSH server to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-startups 3
```

To set max-startups parameters of SSH server to the default configuration, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server max-startups
```

To support the Secure Shell server with TCP port 2200, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server 2200
```

**Related commands** [show ssh server](#)  
[ssh client](#)

**Command changes** Version 5.5.1-1.1: support removed for the ssh-rsa algorithm in OpenSSH and for SSH protocol v1

# ssh server allow-users

**Overview** This command adds a username pattern to the allow list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is accepted.

When there are no registered users in the server's database of allowed users, the SSH server does not accept SSH sessions even when enabled.

SSH server also maintains the deny list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

The **no** variant of this command deletes a username pattern from the allow list of the SSH server. To delete an entry from the allow list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server allow-users <username-pattern> [<hostname-pattern>]`  
`no ssh server allow-users <username-pattern>`  
 `[<hostname-pattern>]`

| Parameter                             | Description  |
|---------------------------------------|--|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. An asterisk acts as a wildcard character that matches any string of characters.  |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server allows the user to connect only from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters. |

**Mode** Global Configuration

**Examples** To allow the user `john` to create an SSH session from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john
```

To allow the user `john` to create an SSH session from a range of IP address (from 192.168.1.1 to 192.168.1.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john 192.168.1.*
```

To allow the user `john` to create a SSH session from `a-company.com` domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server allow-users john *.a-company.com
```

To delete the existing user entry `john 192.168.1.*` in the allow list, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server allow-users john 192.168.1.*
```

**Related  
commands**

[show running-config ssh](#)

[show ssh server allow-users](#)

[ssh server deny-users](#)

# ssh server authentication

**Overview** This command enables RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **ssh server authentication** command to enable password authentication for users. Apply the **publickey** keyword with the **ssh server authentication** command to enable RSA public-key authentication for users.

Use the **no** variant of this command to disable RSA public-key or password user authentication for SSH Server. Apply the **password** keyword with the **no ssh authentication** command to disable password authentication for users. Apply the required **publickey** keyword with the **no ssh authentication** command to disable RSA public-key authentication for users.

**Syntax** `ssh server authentication {password|publickey}`  
`no ssh server authentication {password|publickey}`

| Parameter              | Description   |
|------------------------|---|
| <code>password</code>  | Specifies user password authentication for SSH server.  |
| <code>publickey</code> | Specifies user publickey authentication for SSH server. |

**Default** Both RSA public-key authentication and password authentication are enabled by default.

**Mode** Global Configuration

**Usage** For password authentication to authenticate a user, password authentication for a user must be registered in the local user database or on an external RADIUS server, before using the **ssh server authentication password** command.

For RSA public-key authentication to authenticate a user, a public key must be added for the user, before using the **ssh server authentication publickey** command.

**Examples** To enable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication password
```

To enable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server authentication publickey
```

To disable `password` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server authentication password
```

To disable `publickey` authentication for users connecting through SSH, use the commands:

```
awplus# configure terminal
```

```
awplus(config)# no ssh server authentication publickey
```

**Related  
commands**

[crypto key pubkey-chain userkey](#)

[service ssh](#)

[show ssh server](#)

# ssh server deny-users

**Overview** This command adds a username pattern to the deny list of the SSH server. If the user of an incoming SSH session matches the pattern, the session is rejected.

SSH server also maintains the allow list. The server checks the user in the deny list first. If a user is listed in the deny list, then the user access is denied even if the user is listed in the allow list.

If a hostname pattern is specified, the user is denied from the hosts matching the pattern.

The **no** variant of this command deletes a username pattern from the deny list of the SSH server. To delete an entry from the deny list, the username and hostname pattern should match exactly with the existing entry.

**Syntax** `ssh server deny-users <username-pattern> [<hostname-pattern>]`  
`no ssh server deny-users <username-pattern>`  
`[<hostname-pattern>]`

| Parameter                             | Description   |
|---------------------------------------|---|
| <code>&lt;username-pattern&gt;</code> | The username pattern that users can match to. The username must begin with a letter. Valid characters are all numbers, letters, and the underscore, hyphen, full stop and asterisk symbols. An asterisk acts as a wildcard character that matches any string of characters. |
| <code>&lt;hostname-pattern&gt;</code> | The host name pattern that hosts can match to. If specified, the server denies the user only when they connect from hosts matching the pattern. An asterisk acts as a wildcard character that matches any string of characters.   |

**Mode** Global Configuration

**Examples** To deny the user john to access SSH login from any host, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john
```

To deny the user john to access SSH login from a range of IP address (from 192.168.2.1 to 192.168.2.255), use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john 192.168.2.*
```

To deny the user john to access SSH login from b-company.com domain, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server deny-users john*.b-company.com
```

To delete the existing user entry `john 192.168.2.*` in the deny list, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server deny-users john 192.168.2.*
```

**Related commands**

- [show running-config ssh](#)
- [show ssh server deny-users](#)
- [ssh server allow-users](#)

# ssh server disallow-cbc-ciphers

**Overview** Use this command to disallow CBC mode ciphers on SSH servers. You can only use this command when your device is in Secure Mode (see the [crypto secure-mode](#) command).

Use the **no** variant of this command to allow CBC mode ciphers.

**Syntax** `ssh server disallow-cbc-ciphers`  
`no ssh server disallow-cbc-ciphers`

**Default** CBC mode ciphers are allowed by default.

**Mode** Global Configuration

**Example** To disallow CBC mode ciphers for SSH server in Secure Mode, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server disallow-cbc-ciphers
```

**Related commands** [crypto secure-mode](#)  
[service ssh](#)  
[ssh server](#)

**Command changes** Version 5.5.1-2.1: command added

# ssh server max-auth-tries

**Overview** Use this command to specify the maximum number of SSH authentication attempts that the device will allow.

Use the **no** variant of this command to return the maximum number of attempts to its default value of 6.

**Syntax** `ssh server max-auth-tries <1-32>`  
`no ssh server max-auth-tries`

| Parameter | Description  |
|-----------|--|
| <1-32>    | Maximum number of SSH authentication attempts the device will allow. |

**Default** 6 attempts

**Mode** Global Configuration

**Usage** By default, users must wait one second after a failed login attempt before trying again. You can increase this gap by using the command [aaa login fail-delay](#).

**Example** To set the maximum number of SSH authentication attempts to 3, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server max-auth-tries 3
```

**Related commands** [show ssh server](#)

# ssh server resolve-host

**Overview** This command enables resolving an IP address from a host name using a DNS server for client host authentication.

The **no** variant of this command disables this feature.

**Syntax** `ssh server resolve-hosts`  
`no ssh server resolve-hosts`

**Default** This feature is disabled by default.

**Mode** Global Configuration

**Usage notes** Your device has a DNS Client that is enabled automatically when you add a DNS server to your device. Use the [ip name-server](#) command to add a DNS server to the list of servers that the device queries.

**Example** To resolve a host name using a DNS server, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server resolve-hosts
```

**Related commands** [ip name-server](#)  
[show ssh server](#)  
[ssh server allow-users](#)  
[ssh server deny-users](#)

# ssh server scp

**Overview** This command enables the Secure Copy (SCP) service on the SSH server. Once enabled, the server accepts SCP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SCP connections. The SCP service is enabled by default as soon as the SSH server is enabled.

The **no** variant of this command disables the SCP service on the SSH server. Once disabled, SCP requests from remote clients are rejected.

**Syntax** `ssh server scp`  
`no ssh server scp`

**Mode** Global Configuration

**Examples** To enable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server scp
```

To disable the SCP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server scp
```

**Related commands** [show running-config ssh](#)  
[show ssh server](#)

# ssh server secure-ciphers

**Overview** Use this command to set the SSH server to only negotiate ciphers regarded as current-best-practice.

Use the **no** variant of this command to return to the default setting of not set.

**Syntax** `ssh server secure-ciphers`  
`no ssh server secure-ciphers`

| Parameter                   | Description  |
|-----------------------------|--|
| <code>secure-ciphers</code> | Negotiate only with ciphers that are still considered current-best-practice and secure |

**Default** Not set

**Mode** Global Configuration

**Usage notes** This command uses the same cipher string as the OpenSSH default, which excludes CBC, as CBC has been regarded as a weak cipher.

When the command is used, the ciphers included are:  
`chacha20-poly1305@openssh.com`, `aes128-ctr`, `aes192-ctr`, `aes256-ctr`,  
`aes128-gcm@openssh.com`, `aes256-gcm@openssh.com`

**Example** To configure the SSH server to only negotiate ciphers regarded as current best practice, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-ciphers
```

**Related commands** [show ssh server](#)

**Command changes** Version 5.5.0-1.1: command added

# ssh server secure-kex

**Overview** Use this command to specify only key exchange algorithms which are consistent with key exchange algorithms currently considered as best-current-practice to be used by the SSH server.

The algorithm list does not include diffie-hellman-group-exchange-sha1 key exchange algorithm.

Use the **no** variant of this command to disable the SSH server from using more secure key-exchange algorithms.

**Syntax** `ssh server secure-kex`  
`no ssh server secure-kex`

| Parameter               | Description   |
|-------------------------|---|
| <code>secure-kex</code> | Use the best current practice secure key exchange (kex) list. |

**Default** Disabled.

**Mode** Global Configuration

**Example** To enable the SSH server to use more secure key-exchange algorithms, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server secure-kex
```

**Output** Figure 70-11: Example output from **show ssh server**

```
awplus#show ssh server

**Command changes** Version 5.5.0-2.3: command added

# ssh server sftp

**Overview** This command enables the Secure FTP (SFTP) service on the SSH server. Once enabled, the server accepts SFTP requests from remote clients.

You must enable the SSH server as well as this service before the device accepts SFTP connections. The SFTP service is enabled by default as soon as the SSH server is enabled. If the SSH server is disabled, SFTP service is unavailable.

The **no** variant of this command disables SFTP service on the SSH server. Once disabled, SFTP requests from remote clients are rejected.

**Syntax** `ssh server sftp`  
`no ssh server sftp`

**Mode** Global Configuration

**Examples** To enable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# ssh server sftp
```

To disable the SFTP service, use the commands:

```
awplus# configure terminal
awplus(config)# no ssh server sftp
```

# Trigger Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Triggers. For more information, see the [Triggers Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

- Command List**

- [“undebug trigger”](#) on page 4012

# active (trigger)

**Overview** This command enables a trigger. This allows the trigger to activate when its trigger conditions are met.

The **no** variant of this command disables a trigger. While in this state the trigger cannot activate when its trigger conditions are met.

**Syntax** active  
no active

**Default** Active, which means that triggers are enabled by default

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to activate it.

For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To enable trigger 172, so that it can activate when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 172
awplus(config-trigger)# active
```

To disable trigger 182, preventing it from activating when its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 182
awplus(config-trigger)# no active
```

**Related commands** [show trigger](#)  
[trigger](#)  
[trigger activate](#)

# day

**Overview** This command specifies the days or date that the trigger can activate on. You can specify one of:

- A specific date
- A specific day of the week
- A list of days of the week
- A day of any month of any year
- A day of a specific month in any year
- Every day

By default, the trigger can activate on any day.

**Syntax** day every-day  
day <1-31>  
day <1-31> <month>  
day <1-31> <month> <year>  
day <weekday>

| Parameter | Description   |
|-----------|---|
| every-day | Sets the trigger so that it can activate on any day.  |
| <1-31>    | Day of the month the trigger is permitted to activate on.   |
| <month>   | Sets the month that the trigger is permitted to activate on. Valid keywords are: <b>january, february, march, april, may, june, july, august, september, october, november, and december.</b>                               |
| <year>    | Sets the year that the trigger is permitted to activate in, between 2000 and 2035.  |
| <weekday> | Sets the days of the week that the trigger can activate on. You can specify one or more week days in a space separated list. Valid keywords are: <b>monday, tuesday, wednesday, thursday, friday, saturday, and sunday.</b> |

**Default** **every-day**, so by default, the trigger can activate on any day.

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **day** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To permit trigger 55 to activate on the 1 June 2019, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 55
awplus(config-trigger)# day 1 jun 2019
```

To permit trigger 12 to activate on Mondays, Wednesdays and Fridays, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# day monday wednesday friday
```

To permit trigger 17 to activate on the 5th day of any month, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 17
awplus(config-trigger)# day 5
```

To permit trigger 6 to activate on the 20th day of September, in any year, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# day 20 september
```

To permit trigger 14 to activate on the 1st day of each month, in any year, at 11.00am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 14
awplus(config-trigger)# day 1
awplus(config-trigger)# type time 11:00
```

**Related commands** [show trigger](#)  
[type time](#)  
[trigger](#)

**Command changes** Version 5.4.8-2.1: day of the month functionality added

# debug trigger

**Overview** This command enables trigger debugging. This generates detailed messages about how your device is processing the trigger commands and activating the triggers.

The **no** variant of this command disables trigger debugging.

**Syntax** `debug trigger`  
`no debug trigger`

**Mode** Privilege Exec

**Examples** To start trigger debugging, use the command:

```
awplus# debug trigger
```

To stop trigger debugging, use the command:

```
awplus# no trigger
```

**Related commands** [show debugging trigger](#)  
[show trigger](#)  
[test](#)  
[trigger](#)  
[undebug trigger](#)

# description (trigger)

**Overview** This command adds an optional description to help you identify the trigger. This description is displayed in show command outputs and log messages.

The **no** variant of this command removes a trigger's description. The show command outputs and log messages stop displaying a description for this trigger.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;description&gt;</code> | A word or phrase that uniquely identifies this trigger or its purpose. Valid characters are any printable character and spaces, up to a maximum of 40 characters. |

**Mode** Trigger Configuration

**Examples** To give trigger 240 the description `daily status report`, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 240
awplus(config-trigger)# description daily status report
```

To remove the description from trigger 36, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 36
awplus(config-trigger)# no description
```

**Related commands** [show trigger](#)  
[test](#)  
[trigger](#)

# repeat

**Overview** This command specifies the number of times that a trigger is permitted to activate. This allows you to specify whether you want the trigger to activate:

- only the first time that the trigger conditions are met
- a limited number of times that the trigger conditions are met
- an unlimited number of times

Once the trigger has reached the limit set with this command, the trigger remains in your configuration but cannot be activated. Use the **repeat** command again to reset the trigger so that it is activated when its trigger conditions are met.

By default, triggers can activate an unlimited number of times. To reset a trigger to this default, specify either **yes** or **forever**.

**Syntax** `repeat { forever | no | once | yes | <1-4294967294> }`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>yes   forever</code>        | The trigger repeats indefinitely, or until disabled. |
| <code>no   once</code>            | The trigger activates only once.                     |
| <code>&lt;1-4292967294&gt;</code> | The trigger repeats the specified number of times.   |

**Mode** Trigger Configuration

**Examples** To allow trigger 21 to activate only once, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 21
awplus(config-trigger)# repeat no
```

To allow trigger 22 to activate an unlimited number of times whenever its trigger conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 22
awplus(config-trigger)# repeat forever
```

To allow trigger 23 to activate only the first 10 times the conditions are met, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 23
awplus(config-trigger)# repeat 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# script

**Overview** This command specifies one or more scripts that are to be run when the trigger activates. You can add up to five scripts to a single trigger.

The sequence in which the trigger runs the scripts is specified by the number you set before the name of the script file. One script is executed completely before the next script begins.

Scripts may be either ASH shell scripts, indicated by a **.sh** filename extension suffix, or AlliedWare Plus™ scripts, indicated by a **.scp** filename extension suffix. AlliedWare Plus™ scripts only need to be readable.

The **no** variant of this command removes one or more scripts from the trigger's script list. The scripts are identified by either their name, or by specifying their position in the script list. The **all** parameter removes all scripts from the trigger.

**Syntax**

```
script <1-5> {<filename>}
no script {<1-5>|<filename>|all}
```

| Parameter  | Description  |
|------------|--|
| <1-5>      | The position of the script in execution sequence. The trigger runs the lowest numbered script first. |
| <filename> | The path to the script file.   |

**Mode** Trigger Configuration

**Examples** To configure trigger 71 to run the script `flash:/cpu_trig.sh` in position 3 when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# script 3 flash:/cpu_trig.sh
```

To configure trigger 99 to run the scripts **flash:reconfig.scp**, **flash:cpu\_trig.sh** and **flash:email.scp** in positions 2, 3 and 5 when the trigger activates, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 99
awplus(config-trigger)# script 2 flash:/reconfig.scp 3
flash:/cpu_trig.sh 5 flash:/email.scp
```

To remove the scripts 1, 3 and 4 from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script 1 3 4
```

To remove the script flash:/cpu\_trig.sh from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script flash:/cpu_trig.sh
```

To remove all the scripts from trigger 71's script list, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 71
awplus(config-trigger)# no script all
```

**Related commands** [show trigger](#)  
[trigger](#)

# show debugging trigger

**Overview** This command displays the current status for trigger utility debugging. Use this command to show when trigger debugging has been turned on or off from the [debug trigger](#) command.

**Syntax** `show debugging trigger`

**Mode** User Exec and Privileged Exec

**Example** To display the current configuration of trigger debugging, use the command:

```
awplus# show debugging trigger
```

**Output** Figure 71-1: Example output from the **show debugging trigger** command

```
awplus#debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is on

awplus#no debug trigger
awplus#show debugging trigger
Trigger debugging status:
  Trigger debugging is off
```

**Related commands** [debug trigger](#)

# show running-config trigger

**Overview** This command displays the current running configuration of the trigger utility.

**Syntax** `show running-config trigger`

**Mode** Privileged Exec

**Example** To display the current configuration of the trigger utility, use the command:

```
awplus# show running-config trigger
```

**Output** Figure 71-2: Example output from the **show running-config trigger** command

```
trigger 1
  type card in
trigger 2
  type card out
!
```

**Related commands** [show trigger](#)

# show trigger

**Overview** This command displays configuration and diagnostic information about the triggers configured on the device. Specify the **show trigger** command without any options to display a summary of the configuration of all triggers.

**Syntax** `show trigger [<1-250>|counter|full]`

| Parameter | Description   |
|-----------|---|
| <1-250>   | Displays detailed information about a specific trigger, identified by its trigger ID. |
| counter   | Displays statistical information about all triggers.                                  |
| full      | Displays detailed information about all triggers.                                     |

**Mode** Privileged Exec

**Example** To get summary information about all triggers, use the following command:

```
awplus# show trigger
```

Table 71-1: Example output from **show trigger**

```
awplus#show trigger
TR# Type & Details      Name                Ac Te Repeat      #Scr Days/Date
-----
001 CPU (80% any)      Busy CPU            Y  N  5              1  smtwtfS
005 Periodic (30 min)  Regular status check Y  N  Continuous     1  -mtwtf-
007 Memory (85% up)    High mem usage      Y  N  8              1  smtwtfS
011 Time (00:01)       Weekend access      Y  N  Continuous     1  -----s
013 Reboot              Y  N  Continuous     2  smtwtfS
019 Ping-poll (5 up)   Connection to svr1  Y  N  Continuous     1  smtwtfS
-----
```

Table 71-2: Parameters in the output of **show trigger**

| Parameter      | Description  |
|----------------|--|
| TR#            | Trigger identifier (ID).   |
| Type & Details | The trigger type, followed by the trigger details in brackets.                                     |
| Name           | Descriptive name of the trigger configured with the <a href="#">description (trigger)</a> command. |
| Ac             | Whether the trigger is active (Y), or inactive (N).  |
| Te             | Whether the trigger is in test mode (Y) or not (N).  |

Table 71-2: Parameters in the output of **show trigger** (cont.)

| Parameter | Description   |
|-----------|---|
| Repeat    | Whether the trigger repeats continuously, and if not, the configured repeat count for the trigger. To see the number of times a trigger has activated, use the <b>show trigger</b> <1-250> command.                 |
| #Scr      | Number of scripts associated with the trigger.  |
| Days/Date | Days or date when the trigger may be activated. For the days options, the days are shown as a seven character string representing Sunday to Saturday. A hyphen indicates days when the trigger cannot be activated. |

To display detailed information about trigger 3, use the command:

```
awplus# show trigger 3
```

**Table 72:** Parameters in the output of **show trigger full** and **show trigger** for a specific trigger

| Parameter        | Description   |
|------------------|---|
| Trigger          | The ID of the trigger.                                  |
| Name             | Descriptive name of the trigger.                        |
| Type and details | The trigger type and its activation conditions.         |
| Days             | The days on which the trigger is permitted to activate. |

**Table 72:** Parameters in the output of **show trigger full** and **show trigger** for a specific trigger (cont.)

| Parameter             | Description   |
|-----------------------|---|
| Date                  | The date on which the trigger is permitted to activate. Only displayed if configured, in which case it replaces "Days".   |
| Active                | Whether or not the trigger is permitted to activate.  |
| Test                  | Whether or not the trigger is operating in diagnostic mode.   |
| Trap                  | Whether or not the trigger is enabled to send SNMP traps.   |
| Repeat                | Whether the trigger repeats an unlimited number of times (Continuous) or for a set number of times. When the trigger can repeat only a set number of times, then the number of times the trigger has been activated is displayed in brackets. |
| Modified              | The date and time of the last time that the trigger was modified.   |
| Number of activations | Number of times the trigger has been activated since the last restart of the device.  |
| Last activation       | The date and time of the last time that the trigger was activated.  |
| Number of scripts     | How many scripts are associated with the trigger, followed by the names of the script files in the order in which they run.   |

To display counter information about all triggers use the command:

```
awplus# show trigger counter
```

**Figure 71-4:** Example output from **show trigger counter**

```
awplus# show trigger counter
Trigger Module Counters

```

**Related  
commands** [active \(trigger\)](#)  
[debug trigger](#)  
[script](#)  
[trigger](#)  
[trigger activate](#)

# test

**Overview** This command puts the trigger into a diagnostic mode. In this mode the trigger may activate but when it does it will not run any of the trigger's scripts. A log message will be generated to indicate when the trigger has been activated.

The **no** variant of this command takes the trigger out of diagnostic mode, restoring normal operation. When the trigger activates, the scripts associated with the trigger will be run, as normal.

**Syntax** test  
no test

**Mode** Trigger Configuration

**Usage notes** Configure a trigger first before you use this command to diagnose it. For information about configuring a trigger, see the [Triggers\\_Feature Overview and Configuration Guide](#).

**Examples** To put trigger 5 into diagnostic mode, where no scripts will be run when the trigger activates, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# test
```

To take trigger 205 out of diagnostic mode, restoring normal operation, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no test
```

**Related commands** [show trigger](#)  
[trigger](#)

# time (trigger)

**Overview** This command specifies the time of day when the trigger is permitted to activate. The **after** parameter specifies the start of a time period that extends to midnight during which trigger may activate. By default the value of this parameter is 00:00:00 (am); that is, the trigger may activate at any time. The **before** parameter specifies the end of a time period beginning at midnight during which the trigger may activate. By default the value of this parameter is 23:59:59; that is, the trigger may activate at any time. If the value specified for **before** is later than the value specified for **after**, a time period from “after” to “before” is defined, during which the trigger may activate. This command is not applicable to time triggers ( **type time**).

The following figure illustrates how the **before** and **after** parameters operate.

**Syntax** `time {[after <hh:mm:ss>] [before <hh:mm:ss>]}`

| Parameter                           | Description   |
|-------------------------------------|---|
| <code>after&lt;hh:mm:ss&gt;</code>  | The earliest time of day when the trigger may be activated. |
| <code>before&lt;hh:mm:ss&gt;</code> | The latest time of day when the trigger may be activated.   |

**Mode** Trigger Configuration

**Usage notes** For example trigger configurations that use the **time (trigger)** command, see “Restrict Internet Access” and “Turn off Power to Port LEDs” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To allow trigger 63 to activate between midnight and 10:30am, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 63
awplus(config-trigger)# time before 10:30:00
```

To allow trigger 64 to activate between 3:45pm and midnight, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 64
awplus(config-trigger)# time after 15:45:00
```

To allow trigger 65 to activate between 10:30am and 8:15pm, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 65
awplus(config-trigger)# time after 10:30:00 before 20:15:00
```

**Related commands** [show trigger](#)  
[trigger](#)

# trap

**Overview** This command enables the specified trigger to send SNMP traps.  
Use the **no** variant of this command to disable the sending of SNMP traps from the specified trigger.

**Syntax** trap  
no trap

**Default** SNMP traps are enabled by default for all defined triggers.

**Mode** Trigger Configuration

**Usage notes** You must configure SNMP before using traps with triggers. For more information, see:

- [Support for Allied Telesis Enterprise\\_MIBs\\_in\\_AlliedWare Plus](#), for information about which MIB objects are supported.
- the [SNMP Feature Overview and Configuration\\_Guide](#).
- the [SNMP Commands](#) chapter.

Since SNMP traps are enabled by default for all defined triggers, a common usage will be for the **no** variant of this command to disable SNMP traps from a specified trap if the trap is only periodic. Refer in particular to AT-TRIGGER-MIB in the [Support for Allied Telesis Enterprise\\_MIBs\\_in AlliedWare Plus](#) for further information about the relevant SNMP MIB.

**Examples** To enable SNMP traps to be sent from trigger 5, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# trap
```

To disable SNMP traps being sent from trigger 205, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 205
awplus(config-trigger)# no trap
```

**Related commands** trigger  
show trigger

# trigger

**Overview** This command is used to access the Trigger Configuration mode for the specified trigger. Once Trigger Configuration mode has been entered the trigger type information can be configured and the trigger scripts and other operational parameters can be specified. At a minimum the trigger type information must be specified before the trigger can become active.

The **no** variant of this command removes a specified trigger and all configuration associated with it.

**Syntax** trigger <1-250>  
no trigger <1-250>

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Global Configuration

**Examples** To enter trigger configuration mode for trigger 12, use the commands:

```
awplus# configure terminal  
awplus(config)# trigger 12
```

To completely remove all configuration associated with trigger 12, use the commands:

```
awplus# configure terminal  
awplus(config)# no trigger 12
```

**Related commands** [show trigger](#)  
[trigger activate](#)

# trigger activate

**Overview** This command is used to manually activate a specified trigger from the Privileged Exec mode, which has been configured with the **trigger** command from the Global Configuration mode.

**Syntax** `trigger activate <1-250>`

| Parameter | Description   |
|-----------|---------------|
| <1-250>   | A trigger ID. |

**Mode** Privileged Exec

**Usage notes** This command manually activates a trigger without the normal trigger conditions being met.

The trigger is activated even if it has been configured as inactive by using the command **no active**. The scripts associated with the trigger will be executed even if the trigger is in the diagnostic test mode.

Triggers activated manually do not have their repeat counts decremented or their 'last triggered' time updated, and do not result in updates to the '[type] triggers today' counters.

**Example** To manually activate trigger 12 use the command:

```
awplus# trigger activate 12
```

**Related commands**

- [show trigger](#)
- [trigger](#)

# type atmf guest

**Overview** This command configures a trigger to activate when an AMF guest node joins or leaves.

**Syntax** `type atmf guest {join|leave}`

| Parameter | Description            |
|-----------|------------------------|
| join      | AMF guest node joins.  |
| leave     | AMF guest node leaves. |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when an AMF guest node leaves, use the following commands:

```
awplus(config)# trigger 86
awplus(config-trigger)# type atmf guest leave
```

**Related commands** [show trigger](#)

**Command changes** Version 5.5.1-1.1: command added

# type atmf node

**Overview** This command configures a trigger to activate when an AMF node joins or leaves.

**Syntax** `type atmf node {join|leave}`

| Parameter | Description      |
|-----------|------------------|
| join      | AMF node joins.  |
| leave     | AMF node leaves. |

**Mode** Trigger Configuration

**Example 1** To configure trigger 5 to activate when an AMF node leaves, use the following commands. In this example the command is entered on node-1:

```
node1(config)# trigger 5
node1(config-trigger)# type atmf node leave
```

**Example 2** The following commands will configure trigger 5 to activate if an AMF node join event occurs on any node within the working set:

```
node1# atmf working-set group all
```

This command returns the following display:

```
=====
node1, node2, node3:
=====

Working set join
```

Note that the running the above command changes the prompt from the name of the local node, to the name of the AMF-Network followed, in square brackets, by the number of member nodes in the working set.

```
AMF-Net[3]# conf t
AMF-Net[3](config)# trigger 5
AMF-Net[3](config-trigger)# type atmf node leave
AMF-Net[3](config-trigger)# description "E-mail on AMF Exit"
AMF-Net[3](config-trigger)# active
```

Enter the name of the script to run at the trigger event.

```
AMF-Net[3](config-trigger)# script 1 email_me.scp
AMF-Net[3](config-trigger)# end
```

### Display the trigger configurations

```
AMF-Net[3]# show trigger
```

This command returns the following display:

```
=====
node1:
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
001 Periodic (2 min)    Periodic Status Chk Y  N  Y Continuous    1  smtwtfS
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----

=====
Node2, Node3,
=====

TR# Type & Details      Description          Ac Te Tr Repeat      #Scr Days/Date
-----
005 ATMF node (leave)  E-mail on ATMF Exit Y  N  Y Continuous    1  smtwtfS
-----
```

### Display the triggers configured on each of the nodes in the AMF Network.

```
AMF-Net[3]# show running-config trigger
```

This command returns the following display:

```
=====
Node1:
=====

trigger 1
  type periodic 2
  script 1 atmf.scp
trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!

=====
Node2, Node3:
=====

trigger 5
  type atmf node leave
description "E-mail on ATMF Exit"
  script 1 email_me.scp
!
```

**Related commands** [show trigger](#)

# type cpu

**Overview** This command configures a trigger to activate based on CPU usage level. Selecting the **up** option causes the trigger to activate when the CPU usage exceeds the specified usage level. Selecting the **down** option causes the trigger to activate when CPU usage drops below the specified usage level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type cpu <1-100> [up|down|any]`

| Parameter | Description  |
|-----------|--|
| <1-100>   | The percentage of CPU usage at which to trigger.                       |
| up        | Activate when CPU usage exceeds the specified level.                   |
| down      | Activate when CPU usage drops below the specified level                |
| any       | Activate when CPU usage passes the specified level in either direction |

**Mode** Trigger Configuration

**Usage notes** For an example trigger configuration that uses the **type cpu** command, see “Capture Unusual CPU and RAM Activity” in the [Triggers Feature Overview and Configuration Guide](#).

**Examples** To configure trigger 28 to be a CPU trigger that activates when CPU usage exceeds 80% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 28
awplus(config-trigger)# type cpu 80 up
```

To configure trigger 5 to be a CPU trigger that activates when CPU usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65

or

awplus# configure terminal
awplus(config)# trigger 5
awplus(config-trigger)# type cpu 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type interface

**Overview** This command configures a trigger to activate based on the link status of an interface. The trigger can be activated when the interface becomes operational by using the **up** option, or when the interface closes by using the **down** option. The trigger can also be configured to activate when either one of these events occurs by using the **any** option.

**Syntax** `type interface <interface> {up|down|any}`

| Parameter   | Description   |
|-------------|---|
| <interface> | Interface name.                                       |
| up          | Activate when interface becomes operational.          |
| down        | Activate when the interface closes.                   |
| any         | Activate when any interface link status event occurs. |

**Mode** Trigger Configuration

**Example** To configure trigger 19 to be an interface trigger that activates when port1.0.1 becomes operational, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 19
awplus(config-trigger)# type interface port1.0.1 up
```

**Related commands** [show trigger](#)  
[trigger](#)

# type linkmon-probe

**Overview** Use this command to create a trigger that will run a script when a Link Health Monitoring probe reports that a link becomes “good”, “bad”, or “unreachable”.

**Syntax** `type linkmon-probe <probename> <profilename>  
{good|bad|unreachable|any}`

| Parameter     | Description  |
|---------------|--|
| <probename>   | The name of the Link Health Monitoring probe that will be used for executing the trigger.  |
| <profilename> | The name of the Link Health Monitoring performance profile that will be used for determine if the Link Health Monitoring probe is good, bad, or unreachable. |
| good          | If the Link Health Monitoring probe becomes 'good' according to the Link Health Monitoring performance profile then the trigger will be executed.            |
| bad           | If the Link Health Monitoring probe goes 'bad' according to the Link Health Monitoring performance profile then the trigger will be executed.                |
| unreachable   | If the Link Health Monitoring probe becomes 'unreachable' according to the Link Health Monitoring performance profile then the trigger will be executed.     |
| any           | If the Link Health Monitoring probe changes state according to the Link Health Monitoring performance profile then the trigger will be executed.             |

**Mode** Trigger Configuration

**Example** When the Link Health Monitoring probes sent to the “test-probe” destination no longer meet the performance profile “test-profile” the link will be deemed “bad”. To create a trigger that will run a script when a Link Health Monitoring probe is deemed “bad”, use the following commands:

```
awplus# trigger 1  
awplus(config)# script 1 link-bad.scp  
awplus(config)# type linkmon-probe test-probe test-profile bad
```

To create a trigger that will run a script when the link is deemed “good” again, use the following commands:

```
awplus# trigger 2  
awplus(config)# script 1 link-good.scp  
awplus(config)# type linkmon-probe test-probe test-profile good
```

**Related commands** [trigger](#)

**Command changes** Version 5.4.8-1.1: command added

# type log

**Overview** Use this command to configure a trigger to activate based on the content of log messages matching a string or regular expression.

**Syntax** `type log <log-message-string>`

| Parameter                               | Description  |
|---|--|
| <code>&lt;log-message-string&gt;</code> | A string or a regular expression (PCRE) to match a log message or part of a log message. |

**Default** There is no type or log message string set by default.

**Mode** Trigger Configuration

**Usage notes** Log type triggers fully support regular expressions using PCRE (Perl-Compatible Regular Expression) syntax.

Only log messages of severity level notice or higher can activate a trigger.

Note that any command executed by the script will generate a log message with level notice, and will include '[SCRIPT]' before the command string. Therefore, if something in the script matches the configured log message trigger string, it will retrigger indefinitely.

**Example** To configure trigger 6 to activate when a log message of level notice or higher indicates that any port has 'failed', use the commands:

```
awplus# configure terminal
awplus(config)# trigger 6
awplus(config-trigger)# type log port.+ failed
```

**Related commands** [show trigger](#)  
[trigger](#)

**Command changes** Version 5.4.7-2.1: command added

# type memory

**Overview** This command configures a trigger to activate based on RAM usage level. Selecting the **up** option causes the trigger to activate when memory usage exceeds the specified level. Selecting the **down** option causes the trigger to activate when memory usage drops below the specified level. Selecting **any** causes the trigger to activate in both situations. The default is **any**.

**Syntax** `type memory <1-100> [up|down|any]`

| Parameter | Description  |
|-----------|--|
| <1-100>   | The percentage of memory usage at which to trigger.                        |
| up        | Activate when memory usage exceeds the specified level.                    |
| down      | Activate when memory usage drops below the specified level.                |
| any       | Activate when memory usage passes the specified level in either direction. |

**Mode** Trigger Configuration

**Examples** To configure trigger 12 to be a memory trigger that activates when memory usage exceeds 50% use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 12
awplus(config-trigger)# type memory 50 up
```

To configure trigger 40 to be a memory trigger that activates when memory usage either rises above or drops below 65%, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65
```

or

```
awplus# configure terminal
awplus(config)# trigger 40
awplus(config-trigger)# type memory 65 any
```

**Related commands** [show trigger](#)  
[trigger](#)

# type periodic

**Overview** This command configures a trigger to be activated at regular intervals. The time period between activations is specified in minutes.

**Syntax** `type periodic <1-1440>`

| Parameter                   | Description                                |
|-----------------------------|--|
| <code>&lt;1-1440&gt;</code> | The number of minutes between activations. |

**Mode** Trigger Configuration

**Usage notes** A combined limit of 10 triggers of the type periodic and time can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or periodic
```

For an example trigger configuration that uses the **type periodic** command, see "See Daily Statistics" in the [Triggers\\_Feature Overview and Configuration Guide](#).

**Example** To configure trigger 44 to activate periodically at 10 minute intervals use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 44
awplus(config-trigger)# type periodic 10
```

**Related commands** [show trigger](#)  
[trigger](#)

# type ping-poll

**Overview** This command configures a trigger that activates when Ping Polling identifies that a target device's status has changed. This allows you to run a configuration script when a device becomes reachable or unreachable.

**Syntax** `type ping-poll <1-100> {up|down}`

| Parameter | Description   |
|-----------|---|
| <1-100>   | The ping poll ID.   |
| up        | The trigger activates when ping polling detects that the target is reachable.   |
| down      | The trigger activates when ping polling detects that the target is unreachable. |

**Mode** Trigger Configuration

**Example** To configure trigger 106 to activate when ping poll 12 detects that its target device is now unreachable, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 106
awplus(config-trigger)# type ping-poll 12 down
```

**Related commands** [show trigger](#)  
[trigger](#)

# type reboot

**Overview** This command configures a trigger that activates when your device is rebooted.

**Syntax** type reboot

**Mode** Trigger Configuration

**Example** To configure trigger 32 to activate when your device reboots, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 32
awplus(config-trigger)# type reboot
```

**Related commands** [show trigger](#)  
[trigger](#)

# type stack disabled-master

**Overview** This command (configured to the stack) configures a trigger to activate on a stack member if it becomes the disabled master.

A disabled master has the same configuration as the active master, but has all its links shutdown.

Although this command could activate any trigger script, the intention here is that the script will reactivate the links from their previously shutdown state, to enable the user to manage the device. An appropriate trigger script must already exist that will apply the [shutdown](#) command on the deactivated links.

**CAUTION:** *It is important that any ports that are configured as trunked ports across master and stack members are disabled at their stack member termination when operating in the fallback configuration. Otherwise, the trunked ports will not function correctly on the device that is connected downstream.*

If the [stack virtual-mac](#) command is enabled, the stack uses a virtual MAC address. The stack will always use this MAC address and the new elected master will still retain the originally configured virtual MAC address. If the **stack virtual-mac** command is disabled, the stack will use the MAC address of the current master. If the stack master fails, the stack MAC address changes to reflect the new master's MAC address. For more information about virtual MAC addresses, see the [VCStack Feature Overview and Configuration Guide](#).

**Syntax** `type stack disabled-master`

**Mode** Trigger Configuration

**Examples** To configure trigger 82 to activate on a device if it becomes the disabled master, use the following commands. These commands enter the Trigger Configuration mode for trigger 82, specify the trigger type, and then specify the script to run.

```
awplus# configure terminal
awplus(config)# trigger 82
awplus(config-trigger)# type stack disabled master
awplus(config-trigger)# script 1 flash:/disabled.scp
awplus(config-trigger)# exit
```

**Related commands**

- [stack disabled-master-monitoring](#)
- [trigger](#)
- [type stack master-fail](#)
- [type stack member](#)
- [type stack link](#)

# type stack link

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a stacking link is either activated or deactivated.

**Syntax** `type stack link {up|down}`

| Parameter | Description           |
|-----------|-----------------------|
| up        | Stack link up event   |
| down      | Stack link down event |

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when the stack link down event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack link down
```

**Related commands** [show trigger](#)  
[trigger](#)

[type stack master-fail](#)

# type stack master-fail

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when the stack enters the fail-over state.

**Syntax** `type stack master-fail`

**Mode** Trigger Configuration

**Example** To configure trigger 86 to activate when stack master fail-over event occurs, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack master-fail
```

**Related commands**

- [stack disabled-master-monitoring](#)
- [trigger](#)
- [type stack disabled-master](#)
- [type stack member](#)
- [type stack link](#)

# type stack member

**Overview** This command (configured to the stack) initiates the action of a pre-configured trigger to occur when a device either joins or leaves the stack.

**Syntax** `type stack member {join|leave}`

| Parameter | Description          |
|-----------|----------------------|
| join      | Neighbor join event  |
| leave     | Neighbor leave event |

**Mode** Trigger Configuration

**Example** To configure a pre-configured trigger number 86 to activate when a new device joins the stack.

Note that the number 86 has no particular significance: you can assign any (previously created) numbered trigger.

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type stack member join
```

**Related commands** [trigger](#)  
[type stack master-fail](#)  
[type stack link](#)

# type time

**Overview** This command configures a trigger that activates at a specified time of day.

**Syntax** `type time <hh:mm>`

| Parameter                  | Description                       |
|----------------------------|-----------------------------------|
| <code>&lt;hh:mm&gt;</code> | The time to activate the trigger. |

**Mode** Trigger Configuration

**Usage** A combined limit of 10 triggers of the type time and type periodic can be configured. If you attempt to add more than 10 triggers the following error message is displayed:

```
% Cannot configure more than 10 triggers with the type time or periodic
```

**Example** To configure trigger 86 to activate at 15:53, use the following commands:

```
awplus# configure terminal
awplus(config)# trigger 86
awplus(config-trigger)# type time 15:53
```

**Related commands** [show trigger](#)  
[trigger](#)

# type usb

**Overview** Use this command to configure a trigger that activates on either the removal or the insertion of a USB storage device.

**Syntax** `type usb {in|out}`

| Parameter | Description   |
|-----------|---|
| in        | Trigger activates on insertion of a USB storage device. |
| out       | Trigger activates on removal of a USB storage device.   |

**Mode** Trigger Configuration

**Usage notes** USB triggers cannot execute script files from a USB storage device.

**Examples** To configure trigger 1 to activate on the insertion of a USB storage device, use the commands:

```
awplus# configure terminal
awplus(config)# trigger 1
awplus(config-trigger)# type usb in
```

**Related commands** [trigger](#)  
[show running-config trigger](#)  
[show trigger](#)

# undebug trigger

**Overview** This command applies the functionality of the **no debug trigger** command.

# 72

# Ping-Polling Commands

## Introduction

**Overview** This chapter provides an alphabetical reference for commands used to configure Ping Polling. For more information, see the [Ping Polling Feature Overview and Configuration Guide](#).

For information on filtering and saving command output, see the [“Getting Started with AlliedWare Plus” Feature Overview and Configuration Guide](#).

Table 72-1: The following table lists the default values when configuring a ping poll

| Default           | Value   |
|-------------------|---|
| Critical-interval | 1 second  |
| Description       | No description  |
| Fail-count        | 5   |
| Length            | 32 bytes  |
| Normal-interval   | 30 seconds  |
| Sample-size       | 5   |
| Source-ip         | The IP address of the interface from which the ping packets are transmitted |
| Time-out          | 1 second  |
| Up-count          | 30  |

# active (ping-polling)

**Overview** This command enables a ping-poll instance. The polling instance sends ICMP echo requests to the device with the IP address specified by the [ip \(ping-polling\)](#) command.

By default, polling instances are disabled. When a polling instance is enabled, it assumes that the device it is polling is unreachable.

The **no** variant of this command disables a ping-poll instance. The polling instance no longer sends ICMP echo requests to the polled device. This also resets all counters for this polling instance.

**Syntax** active  
no active

**Mode** Ping-Polling Configuration

**Examples** To activate the ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# active
```

To disable the ping-poll instance 43 and reset its counters, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no active
```

**Related commands** [debug ping-poll](#)  
[ip \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# clear ping-poll

**Overview** This command resets the specified ping poll, or all ping poll instances. This clears the ping counters, and changes the status of polled devices to unreachable. The polling instance changes to the polling frequency specified with the [critical-interval](#) command. The device status changes to reachable once the device responses have reached the [up-count](#).

**Syntax** `clear ping-poll {<1-100>|all}`

| Parameter | Description  |
|-----------|--|
| <1-100>   | A ping poll ID number. The specified ping poll instance has its counters cleared, and the status of the device it polls is changed to unreachable. |
| all       | Clears the counters and changes the device status of all polling instances.  |

**Mode** Privileged Exec

**Examples** To reset the ping poll instance 12, use the command:

```
awplus# clear ping-poll 12
```

To reset all ping poll instances, use the command:

```
awplus# clear ping-poll all
```

**Related commands** [active \(ping-polling\)](#)  
[ping-poll](#)  
[show ping-poll](#)

# critical-interval

**Overview** This command specifies the time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable.

This command enables the device to quickly observe changes in state, and should be set to a much lower value than the [normal-interval](#) command.

The **no** variant of this command sets the critical interval to the default of one second.

**Syntax** `critical-interval <1-65536>`  
`no critical-interval`

| Parameter | Description  |
|-----------|--|
| <1-65536> | Time in seconds between pings, when the device has failed to a ping, or the device is unreachable. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To set the critical interval to 2 seconds for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# critical-interval 2
```

To reset the critical interval to the default of one second for the ping-polling instance 99, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 99
awplus(config-ping-poll)# no critical-interval
```

**Related commands**

- [fail-count](#)
- [normal-interval](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# debug ping-poll

**Overview** This command enables ping poll debugging for the specified ping-poll instance. This generates detailed messages about ping execution.

The **no** variant of this command disables ping-poll debugging for the specified ping-poll.

**Syntax** `debug ping-poll <1-100>`  
`no debug ping-poll {<1-100>|all}`

| Parameter | Description                       |
|-----------|-----------------------------------|
| <1-100>   | A unique ping poll ID number.     |
| all       | Turn off all ping-poll debugging. |

**Mode** Privileged Exec

**Examples** To enable debugging for ping-poll instance 88, use the command:

```
awplus# debug ping-poll 88
```

To disable all ping poll debugging, use the command:

```
awplus# no debug ping-poll all
```

To disable debugging for ping-poll instance 88, use the command:

```
awplus# no debug ping-poll 88
```

**Related commands**

- [active \(ping-polling\)](#)
- [clear ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)
- [undebug ping-poll](#)

# description (ping-polling)

**Overview** This command specifies a string to describe the ping-polling instance. This allows the ping-polling instance to be recognized easily in show commands. Setting this command is optional.

By default ping-poll instances do not have a description.

Use the **no** variant of this command to delete the description set.

**Syntax** `description <description>`  
`no description`

| Parameter                        | Description   |
|----------------------------------|---|
| <code>&lt;description&gt;</code> | The description of the target. Valid characters are any printable character and spaces. There is no maximum character length. |

**Mode** Ping-Polling Configuration

**Examples** To add the text "Primary Gateway" to describe the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# description Primary Gateway
```

To delete the description set for the ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no description
```

**Related commands** [ping-poll](#)  
[show ping-poll](#)

# fail-count

**Overview** This command specifies the number of pings that must be unanswered, within the total number of pings specified by the [sample-size](#) command, for the ping-polling instance to consider the device unreachable.

If the number set by the [sample-size](#) command and the **fail-count** commands are the same, then the unanswered pings must be consecutive. If the number set by the [sample-size](#) command is greater than the number set by the **fail-count** command, then a device that does not always reply to pings may be declared unreachable.

The **no** variant of this command resets the fail count to the default.

**Syntax** `fail-count <1-100>`  
`no fail-count`

| Parameter                  | Description  |
|----------------------------|--|
| <code>&lt;1-100&gt;</code> | The number of pings within the sample size that a reachable device must fail to respond to before it is classified as unreachable. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To specify the number of pings that must fail within the sample size to determine that a device is unreachable for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# fail-count 5
```

To reset the fail-count to its default of 5 for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no fail-count
```

**Related commands**

- [critical-interval](#)
- [normal-interval](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# ip (ping-polling)

**Overview** This command specifies the IPv4 address of the device you are polling.

**Syntax** `ip {<ip-address>|<ipv6-address>}`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;ip-address&gt;</code>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <code>&lt;ipv6-address&gt;</code> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To set ping-poll instance 5 to poll the device with the IP address 192.168.0.1, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 5
awplus(config-ping-poll)# ip 192.168.0.1
```

To set ping-poll instance 10 to poll the device with the IPv6 address 2001:db8::, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 10
awplus(config-ping-poll)# ip 2001:db8::
```

**Related commands**

- [ping-poll](#)
- [source-ip](#)
- [show ping-poll](#)

# length (ping-poll data)

**Overview** This command specifies the number of data bytes to include in the data portion of the ping packet. This allows you to set the ping packets to a larger size if you find that larger packet types in your network are not reaching the polled device, while smaller packets are getting through. This encourages the polling instance to change the device's status to unreachable when the network is dropping packets of the size you are interested in.

The **no** variant of this command resets the data bytes to the default of 32 bytes.

**Syntax** length <4-1500>  
no length

| Parameter | Description   |
|-----------|---|
| <4-1500>  | The number of data bytes to include in the data portion of the ping packet. |

**Default** The default is 32.

**Mode** Ping-Polling Configuration

**Examples** To specify that ping-poll instance 12 sends ping packet with a data portion of 56 bytes, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length 56
```

To reset the number of data bytes in the ping packet to the default of 32 bytes for ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 12
awplus(config-ping-poll)# length
```

**Related commands** ping-poll  
show ping-poll

# normal-interval

**Overview** This command specifies the time period between pings when the device is reachable.

The **no** variant of this command resets the time period to the default of 30 seconds.

**Syntax** `normal-interval <1-65536>`  
`no normal-interval`

| Parameter                    | Description   |
|------------------------------|---|
| <code>&lt;1-65536&gt;</code> | Time in seconds between pings when the target is reachable. |

**Default** The default is 30 seconds.

**Mode** Ping-Polling Configuration

**Examples** To specify a time period of 60 seconds between pings when the device is reachable for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# normal-interval 60
```

To reset the interval to the default of 30 seconds for ping-poll instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no normal-interval
```

- [sample-size](#)
- [show ping-poll](#)
- [timeout \(ping polling\)](#)
- [up-count](#)

# ping-poll

**Overview** This command enters the ping-poll configuration mode. If a ping-poll exists with the specified number, then this command enters its configuration mode. If no ping-poll exists with the specified number, then this command creates a new ping poll with this ID number.

To configure a ping-poll, create a ping poll using this command, and use the [ip \(ping-polling\)](#) command to specify the device you want the polling instance to poll. It is not necessary to specify any further commands unless you want to change a command's default.

The **no** variant of this command deletes the specified ping poll.

**Syntax** `ping-poll <1-100>`  
`no ping-poll <1-100>`

| Parameter | Description                   |
|-----------|-------------------------------|
| <1-100>   | A unique ping poll ID number. |

**Mode** Global Configuration

**Examples** To create ping-poll instance 3 and enter ping-poll configuration mode, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 3
awplus(config-ping-poll)#
```

To delete ping-poll instance 3, use the commands:

```
awplus# configure terminal
awplus(config)# no ping-poll 3
```

**Related commands**

- [ip \(ping-polling\)](#)
- [length \(ping-poll data\)](#)
- [show ping-poll](#)
- [source-ip](#)

# sample-size

**Overview** This command sets the total number of pings that the polling instance inspects when determining whether a device is unreachable. If the number of pings specified by the **fail-count** command go unanswered within the inspected sample, then the device is declared unreachable.

If the numbers set in this command and **fail-count** command are the same, the unanswered pings must be consecutive. If the number set by this command is greater than that set with the **fail-count** command, a device that does not always reply to pings may be declared unreachable.

You cannot set this command's value lower than the **fail-count** value.

The polling instance uses the number of pings specified by the **up-count** command to determine when a device is reachable.

The **no** variant of this command resets this command to the default.

**Syntax** `sample-size <1-100>`  
`no sample size`

| Parameter | Description   |
|-----------|---|
| <1-100>   | Number of pings that determines critical and up counts. |

**Default** The default is 5.

**Mode** Ping-Polling Configuration

**Examples** To set the sample-size to 50 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# sample-size 50
```

To reset sample-size to the default of 5 for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no sample-size
```

# show counter ping-poll

**Overview** This command displays the counters for ping polling.

**Syntax** show counter ping-poll [*<1-100>*]

| Parameter            | Description   |
|----------------------|---|
| <i>&lt;1-100&gt;</i> | A unique ping poll ID number. This displays the counters for the specified ping poll only. If you do not specify a ping poll, then this command displays counters for all ping polls. |

**Mode** User Exec and Privileged Exec

**Output** Figure 72-1: Example output from the **show counter ping-poll** command

```
Ping-polling counters
Ping-poll: 1
PingsSent           ..... 15
PingsFailedUpState ..... 0
PingsFailedDownState ..... 0
ErrorSendingPing    ..... 2
CurrentUpCount      ..... 13
CurrentFailCount    ..... 0
UpStateEntered      ..... 0
DownStateEntered    ..... 0

Ping-poll: 2
PingsSent           ..... 15
PingsFailedUpState ..... 0
PingsFailedDownState ..... 0
ErrorSendingPing    ..... 2
CurrentUpCount      ..... 13
CurrentFailCount    ..... 0
UpStateEntered      ..... 0
DownStateEntered    ..... 0

Ping-poll: 5
PingsSent           ..... 13
PingsFailedUpState ..... 0
PingsFailedDownState ..... 2
ErrorSendingPing    ..... 2
CurrentUpCount      ..... 9
CurrentFailCount    ..... 0
UpStateEntered      ..... 0
DownStateEntered    ..... 0
```

**Table 73:** Parameters in output of the **show counter ping-poll** command

| Parameter            | Description  |
|----------------------|--|
| Ping-poll            | The ID number of the polling instance.   |
| PingsSent            | The total number of pings generated by the polling instance.   |
| PingsFailedUpState   | The number of unanswered pings while the target device is in the Up state. This is a cumulative counter for multiple occurrences of the Up state.            |
| PingsFailedDownState | Number of unanswered pings while the target device is in the Down state. This is a cumulative counter for multiple occurrences of the Down state.            |
| ErrorSendingPing     | The number of pings that were not successfully sent to the target device.<br>This error can occur when your device does not have a route to the destination. |
| CurrentUpCount       | The current number of sequential ping replies.   |
| CurrentFailCount     | The number of ping requests that have not received a ping reply in the current sample-size window.   |
| UpStateEntered       | Number of times the target device has entered the Up state.  |
| DownStateEntered     | Number of times the target device has entered the Down state.  |

**Example** To display counters for the polling instances, use the command:

```
awplus# show counter ping-poll
```

**Related commands**

- [debug ping-poll](#)
- [ping-poll](#)
- [show ping-poll](#)

# show ping-poll

**Overview** This command displays the settings and status of ping polls.

**Syntax** `show ping-poll [<1-100>|state {up|down}] [brief]`

| Parameter | Description  |   |
|-----------|--|---|
| <1-100>   | Displays settings and status for the specified polling instance.   |   |
| state     | Displays polling instances based on whether the device they are polling is currently reachable or unreachable. |   |
|           | up   | Displays polling instance where the device state is reachable.    |
|           | down   | Displays polling instances where the device state is unreachable. |
| brief     | Displays a summary of the state of ping polls, and the devices they are polling.                               |   |

**Mode** User Exec and Privileged Exec

**Output** Figure 72-2: Example output from the **show ping-poll brief** command

```
Ping Poll Configuration
-----
Id Enabled State Destination
-----
1 Yes Down 192.168.0.1
2 Yes Up 192.168.0.100
```

**Table 74:** Parameters in output of the **show ping-poll brief** command

| Parameter | Meaning   |
|-----------|---|
| Id        | The ID number of the polling instance, set when creating the polling instance with the <a href="#">ping-poll</a> command. |
| Enabled   | Whether the polling instance is enabled or disabled.  |

**Table 74:** Parameters in output of the **show ping-poll brief** command (cont.)

| Parameter     | Meaning  |
|---------------|--|
| State         | The current status of the device being polled:   |
| Up            | The device is reachable.   |
| Down          | The device is unreachable.   |
| Critical Up   | The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down.    |
| Critical Down | The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up. |
| Destination   | The IP address of the polled device, set with the <code>ip (ping-polling)</code> command.  |

**Figure 72-3:** Example output from the **show ping-poll** command

```

Ping Poll Configuration
-----

Poll 1:
Description                : Primary Gateway
Destination IP address      : 192.168.0.1
Status                      : Down
Enabled                     : Yes
Source IP address          : 192.168.0.10
Critical interval           : 1
Normal interval            : 30
Fail count                  : 10
Up count                    : 5
Sample size                 : 50
Length                      : 32
Timeout                    : 1
Debugging                   : Enabled
    
```

```

Poll 2:
Description                : Secondary Gateway
Destination IP address     : 192.168.0.100
Status                    : Up
Enabled                   : Yes
Source IP address         : Default
Critical interval         : 5
Normal interval           : 60
Fail count                : 20
Up count                  : 30
Sample size               : 100
Length                    : 56
Timeout                   : 2
Debugging                 : Enabled
    
```

**Table 75:** Parameters in output of the **show ping-poll** command

| Parameter              | Description   |   |
|------------------------|---|---|
| Description            | Optional description set for the polling instance with the <a href="#">description (ping-polling)</a> command.  |   |
| Destination IP address | The IP address of the polled device, set with the <a href="#">ip (ping-polling)</a> command.  |   |
| Status                 | The current status of the device being polled:  |   |
|                        | Up  | The device is reachable.  |
|                        | Down  | The device is unreachable.  |
|                        | Critical Up   | The device is reachable but recently the polling instance has not received some ping replies, so the polled device may be going down. |
| Critical Down          | The device is unreachable but the polling instance received a reply to the last ping packet, so the polled device may be coming back up.  |   |
| Enabled                | Whether the polling instance is enabled or disabled. The <a href="#">active (ping-polling)</a> and <a href="#">active (ping-polling)</a> commands enable and disable a polling instance.                              |   |
| Source IP address      | The source IP address sent in the ping packets. This is set using the <a href="#">source-ip</a> command.  |   |
| Critical interval      | The time period in seconds between pings when the polling instance has not received a reply to at least one ping, and when the device is unreachable. This is set with the <a href="#">critical-interval</a> command. |   |
| Normal interval        | The time period between pings when the device is reachable. This is set with the <a href="#">normal-interval</a> command.   |   |

**Table 75:** Parameters in output of the **show ping-poll** command (cont.)

| Parameter   | Description  |
|-------------|--|
| Fail count  | The number of pings that must be unanswered, within the total number of pings specified by the <a href="#">sample-size</a> command, for the polling instance to consider the device unreachable. This is set using the <a href="#">fail-count</a> command. |
| Up count    | The number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again. This is set using the <a href="#">up-count</a> command.   |
| Sample size | The total number of pings that the polling instance inspects when determining whether a device is unreachable. This is set using the <a href="#">sample-size</a> command.  |
| Length      | The number of data bytes to include in the data portion of the ping packet. This is set using the <a href="#">length (ping-poll data)</a> command.   |
| Timeout     | The time in seconds that the polling instance waits for a response to a ping packet. This is set using the <a href="#">timeout (ping polling)</a> command.   |
| Debugging   | Indicates whether ping polling debugging is <b>Enabled</b> or <b>Disabled</b> . This is set using the <a href="#">debug ping-poll</a> command.   |

**Examples** To display the ping poll settings and the status of all the polls, use the command:

```
awplus# show ping-poll
```

To display a summary of the ping poll settings, use the command:

```
awplus# show ping-poll brief
```

To display the settings for ping poll 6, use the command:

```
awplus# show ping-poll 6
```

To display a summary of the state of ping poll 6, use the command:

```
awplus# show ping-poll 6 brief
```

To display the settings of ping polls that have reachable devices, use the command:

```
awplus# show ping-poll state up
```

To display a summary of ping polls that have unreachable devices, use the command:

```
awplus# show ping-poll state down brief
```

**Related commands** [debug ping-poll](#)  
[ping-poll](#)

# source-ip

**Overview** This command specifies the source IP address to use in ping packets.

By default, the polling instance uses the address of the interface through which it transmits the ping packets. It uses the device's local interface IP address when it is set. Otherwise, the IP address of the interface through which it transmits the ping packets is used.

The **no** variant of this command resets the source IP in the packets to the device's local interface IP address.

**Syntax** `source-ip {<ip-address>|<ipv6-address>}`  
`no source-ip`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;ip-address&gt;</code>   | An IPv4 address in dotted decimal notation A.B.C.D |
| <code>&lt;ipv6-address&gt;</code> | An IPv6 address in hexadecimal notation X:X::X:X   |

**Mode** Ping-Polling Configuration

**Examples** To configure the ping-polling instance 43 to use the source IP address 192.168.0.1 in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 192.168.0.1
```

To configure the ping-polling instance 43 to use the source IPv6 address 2001:db8:: in ping packets, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# source-ip 2001:db8::
```

To reset the source IP address to the device's local interface IP address for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no source-ip
```

**Related commands**

- description (ping-polling)
- ip (ping-polling)
- length (ping-poll data)
- ping-poll
- show ping-poll

# timeout (ping polling)

**Overview** This command specifies the time in seconds that the polling instance waits for a response to a ping packet. You may find a higher time-out useful in networks where ping packets have a low priority.

The **no** variant of this command resets the set time out to the default of one second.

**Syntax** `timeout <1-30>`  
`no timeout`

| Parameter | Description  |
|-----------|--|
| <1-30>    | Length of time, in seconds, that the polling instance waits for a response from the polled device. |

**Default** The default is 1 second.

**Mode** Ping-Polling Configuration

**Examples** To specify the timeout as 5 seconds for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# timeout 5
```

To reset the timeout to its default of 1 second for ping-poll instance 43, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 43
awplus(config-ping-poll)# no timeout
```

- [normal-interval](#)
- [ping-poll](#)
- [sample-size](#)
- [show ping-poll](#)
- [up-count](#)

# up-count

**Overview** This command sets the number of consecutive pings that the polling instance must receive a reply to before classifying the device reachable again.

The **no** variant of this command resets the up count to the default of 30.

**Syntax** `up-count <1-100>`  
`no up-count`

| Parameter                  | Description  |
|----------------------------|--|
| <code>&lt;1-100&gt;</code> | Number of replied pings before an unreachable device is classified as reachable. |

**Default** The default is 30.

**Mode** Ping-Polling Configuration

**Examples** To set the upcount to 5 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# up-count 5
```

To reset the upcount to the default value of 30 consecutive pings for ping-polling instance 45, use the commands:

```
awplus# configure terminal
awplus(config)# ping-poll 45
awplus(config-ping-poll)# no up-count
```

# debug sflow

**Overview** This command enables sFlow® debug message logging, for sFlow sampling and polling activity on the specified ports. If no ports are specified, sampling and/or polling debug messages are enabled for all ports.

The **no** variant of this command disables sFlow sampling and or polling debug message logging on the ports selected. If no ports are specified, sampling and/or polling debug messages are disabled on all ports.

**Syntax** `debug sflow [interface <port-list>] [sampling][polling]`  
`no debug sflow [interface <port-list>] [sampling][polling]`

| Parameter   | Description  |
|-------------|--|
| interface   | Interface information.   |
| <port-list> | The ports for which sFlow debug is to be enabled. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. port1.0.12)</li><li>• a continuous range of ports separated by a hyphen, e.g. port1.0.1-1.0.24</li><li>• a comma-separated list of ports and port ranges, e.g. port1.0.1,port1.0.1-1.0.24.</li></ul> |
| sampling    | Debug sFlow sampling for the specified port(s).  |
| polling     | Debug sFlow polling for the specified port(s).   |

**Default** The sFlow sampling and or polling debug is disabled.

**Mode** Privileged Exec

**Examples** To enable sFlow debug message logging for polling and sampling on port1.0.1 and port1.0.7, use the commands:

```
awplus# debug sflow interface port1.0.1,port1.0.7 sampling  
polling
```

To enable logging and polling of sFlow debug messages for polling and sampling on all ports, use the command:

```
awplus# debug sflow sampling polling
```

**Related commands** [show debugging sflow](#)  
[no debug all](#)

# debug sflow agent

**Overview** This command enables sFlow® debug message logging that is not specific to particular ports. For example, sending an sFlow datagram to the collector.

The **no** variant of this command applies the command default.

**Syntax** `debug sflow agent`  
`no debug sflow agent`

**Default** The sFlow agent debug message logging (that is not port specific) is disabled.

**Mode** Privileged Exec

**Example** To enable logging of sFlow agent debug messages, use the following command:

```
awplus# debug sflow agent
```

**Related commands** [show debugging sflow](#)  
[debug sflow](#)

# sflow agent

**Overview** This command sets the sFlow® agent IP address on the switch. This address is inserted into every sFlow datagram sent from the sFlow agent switch to the sFlow collector device. The sFlow collector can then use this address to uniquely identify and to access the switch, such as for SNMP. We therefore recommend that you change this address as little as possible.

Although the agent address can be set to any valid IPv4 or IPv6 address; we recommended that you set the sFlow® agent IP address to be the **local address** that is configured on the switch. For information on local addresses and how to set them up, see the [interface \(to configure\)](#) command. This ensures that the sFlow collector can maintain connectivity to the switch irrespective of the addition or deletion of interfaces (each of which will have its own specific IP address). Note that sFlow is rendered inactive whenever the agent address is not set.

The **no** variant of this command applies its default setting to remove a configured address.

**Syntax** `sflow agent {ip <ip-address>|ipv6 <ipv6-address>}`  
`no sflow agent {ip|ipv6}`

| Parameter                         | Description  |
|-----------------------------------|--|
| <code>&lt;ip-address&gt;</code>   | The IPv4 address of the switch that is acting as the sFlow agent.  |
| <code>&lt;ipv6-address&gt;</code> | The IPv6 address of the switch that is acting as the sFlow agent. The IPv6 address uses the format X:X::X:X. |

**Default** The sFlow agent address is unset.

**Mode** Global Configuration

**Examples** To set the sFlow agent (IPv4) address to 192.0.2.23, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ip 192.0.2.23
```

To remove the sFlow agent (IPv4) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ip
```

To set the sFlow agent (IPv6) address to 2001:0db8::1, use the command:

```
awplus# configure terminal
awplus(config)# sflow agent ipv6 2001:0db8::1
```

To remove the sFlow agent (IPv6) address, use the command:

```
awplus# configure terminal
awplus(config)# no sflow agent ipv6
```

**Related commands** `show running-config sflow`  
`show sflow`

# sflow collector

**Overview** This command has been deprecated. It has been replaced by the [sflow collector id](#) command.

This command sets the sFlow® agent's collector IP address and/or UDP port.

**Command changes** Version 5.5.1-1.1: command deprecated.

# sflow collector id

**Overview** Use this command to set the sFlow® agent's collector IP address and optionally the port and maximum datagram size. This is the destination IP address and UDP port, for sFlow datagrams sent from the sFlow agent. The IP address can be any valid IPv4 or IPv6 address.

Use the **no** variant of this command to remove the configuration for that collector and render it inactive.

**Syntax**

```
sflow collector id <1-5> ip <ip-address> [port  
<1-65535>|max-datagram-size <200-1500>]  
  
sflow collector id <1-5> ipv6 <ipv6-address> [port  
<1-65535>|max-datagram-size <200-1500>]  
  
no sflow collector id <1-5>
```

| Parameter         | Description   |
|-------------------|---|
| <ip-address>      | IPv4 address of the remote sFlow collector.   |
| <ipv6-address>    | IPv6 address of remote sFlow collector.<br>The IPv6 address uses the format X::X:X.                     |
| port              | Destination UDP port for sFlow datagrams sent to the collector.   |
| <1-65535>         | UDP port number (default: 6343).  |
| max-datagram-size | The maximum number of bytes that can be sent in an sFlow datagram sent from the agent to the collector. |
| <200-1500>        | The value set for the max-datagram-size.  |

**Default** By default the collector does not exist until configured with a valid IP address.

**Mode** Global Configuration

**Examples** To set the address of collector 1 to 192.168.1.36 with default port and max-datagram size, use the commands:

```
awplus# configure terminal  
awplus(config)# sflow collector id 1 ip 192.168.1.36
```

To set the address of collector 2 to 12ae::213d::213d::333f and use UDP port 500, use the commands:

```
awplus# configure terminal  
awplus(config)# sflow collector id 2 ipv6  
12ae::213d::213d::333f port 500
```

To set the address of collector 5 to 10.42.2.70 and use UDP port 7777 and have a max-datagram-size of 800, use the commands:

```
awplus# configure terminal
awplus(config)# sflow collector id 5 ip 10.42.2.70 port 7777
max-datagram-size 800
```

To delete collector 5, use the commands:

```
awplus# configure terminal
awplus(config)# no sflow collector id 5
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

**Command changes** Version 5.5.1-1.1: command added.

# sflow collector max-datagram-size

**Overview** This command has been deprecated. It has been replaced by the [sflow collector id](#) command.

This command sets the maximum size of the sFlow® datagrams sent to the collector.

**Command changes** Version 5.5.1-1.1: command deprecated

# sflow enable

**Overview** This command enables sFlow® globally on the switch.

The **no** variant of this command disables sFlow globally on the switch.

Note that enabling sFlow does not automatically set its operational status to active. To activate sFlow the following conditions need to be met:

- sFlow is enabled.
- The sFlow agent address is set.
- The sFlow collector address is set to a valid (non zero) IPv4 or IPv6 address.
- Polling or sampling is enabled on the ports to be sampled or polled.

**Syntax** sflow enable  
no sflow enable

**Default** sFlow is disabled globally on the switch.

**Mode** Global Configuration

**Example** To enable sFlow operation, use the command:

```
awplus# configure terminal
awplus(config)# sflow enable
```

**Related commands** [show running-config sflow](#)  
[show sflow](#)

# sflow max-header-size

**Overview** This command sets the maximum header size of the Ethernet frames sampled on a specified port. The maximum header size is measured in bytes, referenced from the first byte of the Ethernet destination address and excludes the Ethernet FCS fields.

If a sampled Ethernet frame is longer than the maximum header size set by this command, then the frame will be truncated to the first N bytes before being placed in the sFlow datagram, where N is the maximum header size set by this command.

The **no** variant of this command resets the max-header-size to its default.

**Syntax** `sflow max-header-size <14-200>`  
`no sflow max-header-size`

| Parameter | Description                                       |
|-----------|---|
| <14-200>  | The maximum number of header bytes to be sampled. |

**Default** The max-header-size is 128 bytes.

**Mode** Interface Configuration

**Usage notes** The header size is measured from the first byte of the Ethernet frame MAC Destination Address.

- For an environment using standard TCP IPv4 over Ethernet frames, consider the following basic protocol structure:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv4 header = 24 bytes

TCP header = 24 bytes

Total = 66 bytes

**CAUTION:** For IPv4, any data existing between 66 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to 128-66=62 bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

For more information, see the [sFlow Feature Overview and Configuration Guide](#).

- A similar consideration can be made for an environment using TCP IPv6 over Ethernet:

Ethernet header (including the 4 byte 802.1Q header component) = 18 bytes

IPv6 header = 40 bytes

TCP header = 24 bytes

Total = 82 bytes

**CAUTION:** For IPv6, any data existing between 82 bytes and the value set by this command will be included in the sFlow packet samples. For example, with the default of 128 applied, up to  $128-82=46$  bytes of user data could be included in the sFlow datagram samples sent between the Agent and the Collector.

Note that the agent-to-collector datagrams contain their own UDP headers, which are outside this calculation.

**Example** To set the maximum header size to 160 bytes for ports 1.0.1 and 1.0.7, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow max-header-size 160
```

**Related commands**

- [show running-config sflow](#)
- [show sflow interface](#)
- [sflow max-header-size](#)

# sflow polling-interval

**Overview** This command sets the sFlow® counter polling interval (in seconds) for the specified ports. A value of 0 disables polling. A counter sample is taken every N seconds where N is the value set by this command.

The **no** variant of this command applies the default.

**Syntax** `sflow polling-interval {0|<1-16777215>}`  
`no sflow polling-interval`

| Parameter    | Description                      |
|--------------|----------------------------------|
| 0            | Disable polling (the default).   |
| <1-16777215> | The polling interval in seconds. |

**Default** The polling-interval is 0 (polling disabled).

**Mode** Interface Configuration

**Example** To set the polling interval to 60 seconds for ports 1.0.1 and 1.0.7, use the following commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.7
awplus(config-if)# sflow polling-interval 60
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# sflow sampling-rate

**Overview** This command sets the mean sFlow® sampling rate for the specified ports. Sampling occurs every N frames (on average), where N is the rate value set via this command. The sampling rate applies to ingress and egress frames independently. For example, a value of 1000 will sample one frame in every 1000 frames received, i.e. one in every 1000 frames sent from the specified port. A value of 0 disables sampling on the specified port(s).

The **no** variant of this command applies the default.

**Syntax** `sflow sampling-rate <256-16777215>`  
`no sflow sampling-rate`

| Parameter      | Description                                       |
|----------------|---|
| <256-16777215> | The sampling rate N, measured in Ethernet frames. |

**Default** The sampling-rate is 0 (sampling disabled).

**Mode** Interface Configuration

**Example** To set the sampling rate to 500 for port1.0.1 and port1.0.3, use the commands:

```
awplus# configure terminal
awplus(config)# interface port1.0.1,port1.0.3
awplus(config-if)# sflow sampling-rate 500
```

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show debugging sflow

**Overview** This command displays sFlow® debug settings for agent operation, and for sampling and polling on specific interface ports. If no interface ports are specified, sampling and polling will be applied to all ports.

**Syntax** `show debugging sflow [interface <port-list>]`

| Parameter                      | Description  |
|--------------------------------|--|
| <code>interface</code>         | The interface information.   |
| <code>&lt;port-list&gt;</code> | The ports for which the sFlow debug settings are to be shown. The ports to display information about. The port list can be: <ul style="list-style-type: none"><li>• a switch port (e.g. <code>port1.0.6</code>)</li><li>• a continuous range of ports separated by a hyphen, e.g. <code>port1.0.1-1.0.6</code></li><li>• a comma-separated list of ports and port ranges, e.g. <code>port1.0.1,port1.0.3-1.0.6</code>.</li></ul> |

**Mode** User Exec and Privileged Exec

**Example** To display sFlow debug settings on the agent, and for sampling and polling on ports 1.0.1 to 1.0.9, use the command:

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

**Output** Figure 73-1: Sample obtained for an sFlow agent

```
awplus# show debugging sflow interface port1.0.1-1.0.9
```

| Port  | Sampling Debug | Polling Debug |
|-------|----------------|---------------|
| 1.0.1 | Enabled        | Enabled       |
| 1.0.2 | Enabled        | -             |
| 1.0.3 | -              | -             |
| 1.0.4 | -              | -             |
| 1.0.5 | -              | -             |
| 1.0.6 | -              | Enabled       |
| 1.0.7 | -              | -             |
| 1.0.8 | -              | Enabled       |
| 1.0.9 | -              | Enabled       |

To display sFlow debug settings for all ports, use the command:

```
awplus# show debugging sflow
```

**Related  
commands** [show running-config sflow](#)  
[show sflow interface](#)

# show running-config sflow

**Overview** This command displays the running system information specific to the sFlow feature.

**Syntax** show running-config sflow

**Mode** Privileged Exec and Global Configuration

**Example** To display the sFlow running configuration information, use the command:

```
awplus# show running-config sflow
```

**Output** Figure 73-2: Example output from the **show running-config sflow** command

```
awplus#sh run sflow
!
sflow agent ip 192.0.2.33
sflow collector ip 192.0.2.65
sflow collector max-datagram-size 1200
sflow enable
!
interface port1.0.11-port1.0.22
 sflow sampling-rate 512
```

**Related commands** [show running-config](#)

# show sflow

**Overview** This command displays non-port-specific sFlow agent configuration and operational status.

**Syntax** show sflow

**Mode** Privileged Exec

**Example** To display sFlow configuration and operational status, use the command:

```
awplus# show sflow
```

## Output

**Table 1:** Example output from the **show sflow** command

|                            |  |
|----------------------------|--|
| sFlow Agent Configuration: | Default Values                             |
| sFlow Admin Status .....   | Disabled [Disabled]                        |
| sFlow Agent Address .....  | [not set] [not set]                        |
| Collector Address .....    | 0.0.0.0 [0.0.0.0]                          |
| Collector UDP Port .....   | 6343 [6343]                                |
| Tx Max Datagram Size ..... | 1200 [1400]                                |
| sFlow Agent Status:        |  |
| Polling/sampling/Tx .....  | Inactive because:                          |
|                            | - sFlow is disabled                        |
|                            | - Agent Addr is not set                    |
|                            | - Collector Addr is 0.0.0.0                |
|                            | - Polling & sampling disabled on all ports |

**Table 2:** Parameters in the output of the **show sflow** command

| Output Parameter    | Description  |
|---------------------|--|
| sFlow Admin Status  | Whether sFlow agent operation is administratively enabled.   |
| sFlow Agent Address | The sFlow agent IPv4 or IPv6 address for the device. sFlow is rendered inactive whenever the agent address is not set.   |
| Collector Address   | The IPv4 or IPv6 collector address to which sFlow datagrams are sent. sFlow is rendered inactive whenever the collector address is set to 0.0.0.0 or 0:0::0.0. |
| Collector UDP Port  | The UDP port on the collector to which sFlow datagrams are sent.   |

**Table 2:** Parameters in the output of the **show sflow** command (cont.)

| Output Parameter     | Description   |
|----------------------|---|
| Tx Max Datagram Size | The maximum size of the sFlow datagrams sent to the collector.  |
| Polling/sampling/Tx  | Whether sFlow sampling and/or polling (and hence sFlow datagram transmission) are active. If inactive the reasons are listed. |

**Related commands** [show running-config sflow](#)  
[show sflow interface](#)

# show sflow interface

**Overview** This command displays sFlow agent sampling and polling configuration for all ports or a specified port.

**Syntax** `show sflow interface [<ifrang>]`

| Parameter | Description          |
|-----------|----------------------|
| <ifrang>  | The interface range. |

**Mode** Privileged Exec

**Example** To display the sFlow sampling and polling configuration for port1.0.1, use the command:

```
awplus# show sflow interface port1.0.1
```

**Output** Figure 73-3: Example output from the **show sflow interface** command

```
awplus#show sflow interface

sFlow Port Configuration:
  Default Values:
    Sampling Rate ..... 0 pkts (= disabled)
    Max Sample Header Size .. 128 bytes
    Polling Interval ..... 0 secs (= disabled)

      Sampling      Max Header      Polling
      Rate          Size          Interval
Port      (1 in N pkts) (bytes)      (secs)
-----
port1.0.1          0          128          0
port1.0.2          0          128          0
port1.0.3          0          128          0
...
```

# undebug sflow

**Overview** This command applies the functionality of the **no** variant of the [debug sflow](#) command.

## Introduction

**Overview** This chapter provides an alphabetical reference of commands used to configure MODBUS (Modicon Communication Bus).

MODBUS is a serial communications protocol for client-server communication between a switch (server) and a device in the network running MODBUS client software (client). You can use MODBUS to connect a computer to a remote terminal unit (RTU) in supervisory control and data acquisition (SCADA) systems.

The MODBUS feature allows AlliedWare Plus™ devices to be used for some SCADA processes - such as gathering sensor and alarm information and to control and monitor the state of ports and their PoE state.

The device encapsulates a request or response message in a MODBUS TCP application data unit (ADU). A client sends a message to a TCP port on the switch. The default port number is 502.

For more information, see the [MODBUS Feature Overview and Configuration Guide](#).

- Command List**
- [“clear scada modbus tcp server connection”](#) on page 4060
  - [“clear scada modbus tcp server statistics”](#) on page 4061
  - [“scada modbus tcp server access”](#) on page 4062

# clear scada modbus tcp server connection

**Overview** Use this command to forcefully disconnect a MODBUS client that is currently connected to the MODBUS TCP server.

**Syntax** `clear scada modbus tcp server connection <ip-address> <1-65535>`

| Parameter                       | Description  |
|---------------------------------|--|
| <code>&lt;ip-address&gt;</code> | The IPv4 or IPv6 address of the MODBUS TCP server. |
| <code>&lt;1-65535&gt;</code>    | The port ID number.                                |

**Mode** Privileged Exec

**Example** To forcefully disconnect a client from the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# clear scada modbus tcp server connection
198.51.100.200 33229
```

**Related commands**

- [scada modbus tcp server access](#)
- [clear scada modbus tcp server statistics](#)
- [show scada modbus tcp server connections](#)

**Command changes**

- Version 5.4.8-2.1: command added
- Version 5.4.9-0.1: MODBUS support added for x930, x950 series
- Version 5.5.0-1.1: MODBUS support added for IE510 series

# clear scada modbus tcp server statistics

**Overview** Use this command to reset the MODBUS TCP server statistics.

**Syntax** `clear scada modbus tcp server statistics`

**Mode** Privileged Exec

**Example** To clear the MODBUS TCP server statistics, use the following commands:

```
awplus# configure terminal
awplus(config)# clear scada modbus tcp server statistics
```

**Related commands**

- [scada modbus tcp server port](#)

- Version 5.5.0-1.1: MODBUS support added for IE510 series

# scada modbus tcp server access

**Overview** Use this command to configure the type of requests that are allowed to be made to the MODBUS TCP server.

Use the **no** variant of this command to revert to the default of read-only.

**Syntax** `scada modbus tcp server access {read-only|read-write}`  
`no scada modbus tcp server access`

**Default** Read-only.

**Mode** Global Configuration

**Example** To allow read and write requests to the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server access read-write
```

To change from read-write access back to the default of read-only, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server access
```

**Related commands**

- [scada modbus tcp server port](#)
- [scada modbus tcp server connection](#)
- [show scada modbus tcp server](#)
- [clear scada modbus tcp server connection](#)
- [clear scada modbus tcp server statistics](#)
- [show scada modbus tcp server connections](#)

**Command changes**

- Version 5.4.8-2.1: command added
- Version 5.4.9-0.1: MODBUS support added for x930, x950 series
- Version 5.5.0-1.1: MODBUS support added for IE510 series

# scada modbus tcp server access permit

**Overview** Use this command to limit access to a MODBUS TCP server to specific IP addresses.

When no permitted IP addresses are configured, then any IP address can connect to the MODBUS TCP server.

When permitted IP addresses are configured, only those IP addresses will be allowed to connect to the MODBUS TCP server. All other IP addresses will be rejected.

Use the **no** variant of this command to remove an IP address from the list of permitted addresses.

**Syntax** `scada modbus tcp server access permit <ip-address>`  
`no scada modbus tcp server access permit`

| Parameter                       | Description                         |
|---------------------------------|-------------------------------------|
| <code>&lt;ip-address&gt;</code> | The IPv4 or IPv6 address to permit. |

**Default** No IP addresses are configured.

**Mode** Global Configuration

**Example** To allow only 192.168.2.200 to use the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server access permit
192.168.2.200
```

To remove 192.168.2.200 from the permitted MODBUS TCP server client IP addresses, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server access permit
192.168.2.200
```

**Command changes**

- Version 5.4.9-0.1: command added
- Version 5.5.0-1.1: MODBUS support added for IE510 series

# scada modbus tcp server connection

**Overview** Use this command to configure the maximum number of concurrent MODBUS TCP clients allowed to be connected to the MODBUS TCP server.

Use the **no** variant of this command to revert to the default of 1.

**Syntax** `scada modbus tcp server connection <1-5>`  
`no scada modbus tcp server connection`

| Parameter | Description   |
|-----------|---|
| <1-5>     | The maximum number of concurrent MODBUS TCP clients allowed to be connected to the MODBUS TCP server. |

**Default** 1

**Mode** Global Configuration

**Example** To configure the maximum limit of MODBUS TCP clients to 5, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server connection 5
```

To reset the maximum limit of the MODBUS TCP clients back to the default of 1, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server connection
```

- [scada modbus tcp server access](#)
- [clear scada modbus tcp server connection](#)
- [clear scada modbus tcp server statistics](#)
- [show scada modbus tcp server connections](#)

**Command changes**

- Version 5.4.8-2.1: command added
- Version 5.4.9-0.1: MODBUS support added for x930, x950 series
- Version 5.5.0-1.1: MODBUS support added for IE510 series

# scada modbus tcp server port

**Overview** Use this command to set the port of the MODBUS TCP server on a device. Clients will use this port to connect to the MODBUS TCP server.

Use the **no** variant of this command to disable MODBUS TCP.

**Syntax** `scada modbus tcp server port <0-65535>`  
`no scada modbus tcp server`

| Parameter | Description                              |
|-----------|--|
| <0-65535> | The port number of the MODBUS TCP server |

**Default** Port 502

**Mode** Global Configuration

**Example** To configure port number 34567 as the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server port 34567
```

To reset the port number of the MODBUS TCP server to the default of 502, use the following commands:

```
awplus# configure terminal
awplus(config)# no scada modbus tcp server port
```

# scada modbus tcp server

**Overview** Use this command to enable MODBUS TCP server on a device.  
Use the **no** variant of this command to disable MODBUS TCP.

**Syntax** `scada modbus tcp server`  
`no scada modbus tcp server`

**Default** Disabled

**Mode** Global Configuration

**Example** To enable the MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# scada modbus tcp server
```

Version 5.5.0-1.1: MODBUS support added for IE510 series

# show scada modbus tcp server connections

**Overview** Use this command to display the information and statistics of the currently connected clients to a MODBUS TCP server.

**Syntax** `show scada modbus tcp server connections`

**Mode** User Exec and Privileged Exec

**Example** To display the information and statistics of the currently connected clients to a MODBUS TCP server, use the following commands:

```
awplus# configure terminal
awplus(config)# show scada modbus tcp server connections
```

**Output** Figure 74-1: Example output from **show scada modbus tcp server connections**

```
SCADA MODBUS Client Information
Connected client 1
  IP address      : 192.168.2.200
  Port           : 37509

scada modbus tcp server access

**Command  
changes**

Version 5.4.8-2.1: command added

Version 5.4.9-0.1: MODBUS support added for x930, x950 series

Version 5.5.0-1.1: MODBUS support added for IE510 series

# show scada modbus tcp server

**Overview** Use this command to show the MODBUS TCP server information and statistics.

**Syntax** show scada modbus tcp server

**Mode** User Exec and Privileged Exec

**Example** To display the MODBUS TCP server information and statistics, use the following commands:

```
awplus# configure terminal
awplus(config)# show scada modbus tcp server
```

**Output** Figure 74-2: Example output from **show scada modbus tcp server**

```
SCADA MODBUS Summary Information

MODBUS is enabled for this device
Write access: enabled
Master heartbeat status: Not set
Master heartbeat timeout: 0
-----
TCP Server Characteristics:
  Port          :    502
  Max Connections :    5
Permitted IP addresses:
  192.168.2.200
  2001:db8::1
-----
Statistics:
  Read Requests:
    coils          :          0
    discrete inputs :          0
    holding registers :          3
    input registers :          0

  Write Requests:
    single coil      :          0
    single register  :          0
    multiple coils   :          0
    multiple registers :          0

  Other Requests   :          0

Exceptions:
  illegal function  :          0
  illegal data address :          0
  illegal data value :          1
  slave device failure :          0
```
